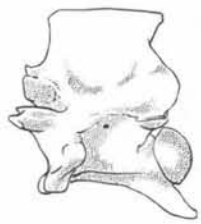
JOURNALS INCLUDED



Listed below are the 273 different journals (several issues of some) in which articles relating to amphibians and reptiles were found during this quarter. This list is intended, not only as an indicator of the highly scattered nature of articles pertaining to these animals, but as a warning. It is unlikely that any one library will have all these journals. None of the large medical, biological or biochemical abstracting services cover all of these journals nor does Zoological Record. How can one find them? Can we ignore them? If someone thinks that some at least can be ignored, which ones? If you have any ideas let us know.

UNREVIEWED-UNEDITED COMMUNICATIONS

Chromosomes of the Sunbeam Snake, Xenopeltis unicolor Reinwardt (Reptilia: Xenopeltidae)

Charles J. Cole and Herndon G. Dowling

The Oriental snake Xenopeltis unicolor has a strange combination of morphological features. Some of these indicate a primitive or generalized status, others are characteristic of "advanced" snakes. Further, none of the details of skull structure or scutellation suggests close relationship with any other Recent snake.

As a result, Xenopeltis has held unique taxonomic status for more than 100 years. First placed in a monotypic taxon by Bonaparte (1845), with the two exceptions mentioned below, it has been maintained as the sole representative of the family Xenopeltidae (Cope, 1864: 230). Only Romer and Hoge have suggested placement in other families: Romer (1956: 570) in Aniliidae, Hoge (1964: 32) in Boidae. Recent authors have not followed either allocation (e.g., Underwood, 1967: 9; Stimson, 1969).

Because the relationships of Xenopeltis unicolor remain in doubt, we present a description of its karyotype. Although based on only a few dividing cells from one individual, the taxonomic importance of the karyotype outweighs the deficiencies of the preparation.

MATERIALS AND METHODS

The snake, an adult male, was purchased from a dealer by Herpetological Information Search Systems. Approximately 0.05 ml. of whole blood obtained by means of direct cardiac puncture immediately was placed in a vial of Difco TC Chromosome Microtest Medium, which had just been activated by the addition of Difco TC Chromosome Microtest Reconstituting Fluid. This culture was incubated for 76 hours at 30 C., during which time resuspension of the cells was accomplished twice daily by gently swirling the vial. After 71 hours, one vial of Difco TC Chromosome Microtest Arresting Solution was mixed into the culture.

Chromosome preparations were made by means of the hypotonic citrate, air-dried technique used by Patton (1967), and stained with Giemsa's Blood Stain. Every square micron of each of the resulting microscope slides was scanned in search of dividing cells suitable for examination. The chromosome terminology is the same as that used by Cole (In press).

The specimen examined is No. 104370 in the herpetological collection of the American Museum of Natural History (AMNH).

RESULTS AND CONCLUSIONS

The chromosomes of only six cells were clear enough for karyotype analysis, and only one of the metaphase-spreads could be considered photogenic. All six cells at metaphase had some degree of overlap of chromosome arms, and some exhibited particularly poor spreading, differential staining, and/or chromosome breakage. Nevertheless, three cells exhibited virtually the same chromosomes, including such details as centromere position, and thus these complements represent the modal karyotype described below. Of the remaining three cells, no two exhibited the same deviant condition, and what could be most clearly observed in all of them was compatible with the karyotype described.

The modal karyotype of this individual of Xenopeltis unicolor includes a diploid number of 36 chromosomes ($2n = 36$), with 16 macrochromosomes and 20 microchromosomes. The chromosomes are arranged in pairs and numbered in order of decreasing length (Fig. 1). Of the macrochromosomes, numbers 1, 3, and 4 are metacentric or essentially so, number 2 is clearly submetacentric, numbers 5 and 6 are subtelocentric with very small short arms, and numbers 7 and 8 are subtelocentric to telocentric. Shapes of the microchromosomes cannot be resolved clearly in most cases. Nevertheless, at least one pair of them (the largest) is metacentric to submetacentric, and most of the others appear to be telocentric. The metacentric and submetacentric macrochromosomes (nos. 1-4) are individually recognized with ease; the remaining macrochromosomes and microchromosomes are not. No secondary constrictions were observed. None of the pairs of chromosomes is obviously heteromorphic, which is not surprising inasmuch as the specimen is a male. In all

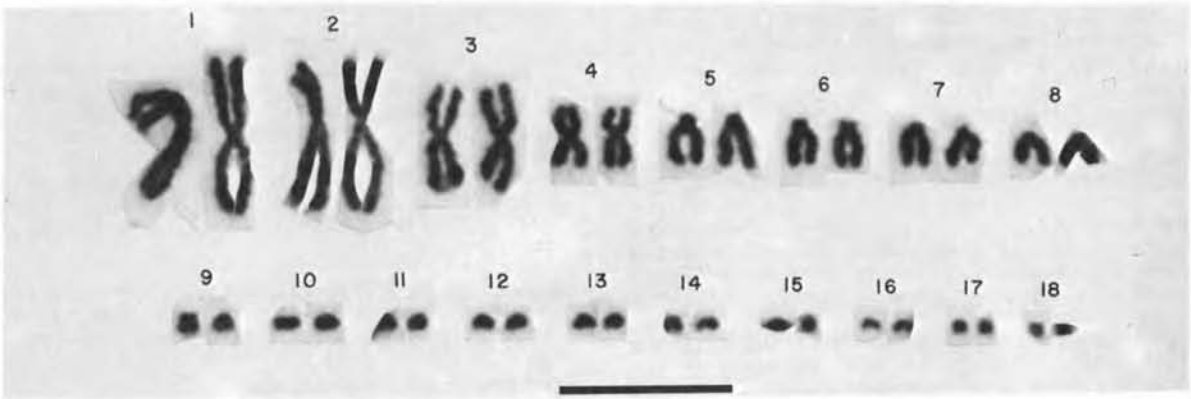

FIG. 1. Representation of the karyotype ($2n = 36$) of a male specimen of Xenopeltis unicolor (AMNH 104370). See text for description. Line represents 10 micra.

species of snakes known to possess heteromorphic pairs of sex chromosomes, the female is the heteromorphic sex (Becak and Becak, 1969).

The karyotype described for Xenopeltis unicolor (Fig. 1) is virtually identical to that of several boids, including Boa constrictor, Epicrates cenchria, Eunectes murinus, and Python molurus (see Becak, 1965, 1968; Singh, Sharma, and Ray-Chaudhuri, 1968). These karyotypes are similar not only in chromosome numbers (2n, macrochromosomes, and microchromosomes), but also in position of the centromere of individual chromosomes. Although a diploid number of 36 chromosomes occurs in many species of snakes in a variety of families, a karyotype such as that in Xenopeltis unicolor and in the boids mentioned above has not been found in any other snake. And considering that the females of these boids do not possess obviously recognizable sex chromosomes, we suspect that this is the case in Xenopeltis unicolor also.

In possessing chromosomes similar to those of B. constrictor, E. cenchria, E. murinus, and P. molurus, Xenopeltis unicolor likewise is karyotypically different from the remaining species of boids whose karyotypes have been described. In Eryx jaculus and Eryx johni there are 18 microchromosomes instead of 20, although the number and morphology of the macrochromosomes appears to be approximately the same as in the other boids (Werner, 1959; Singh, Sharma, and Ray-Chaudhuri, 1968). In Corallus caninus there is a diploid number of 44 chromosomes, including 24 macrochromosomes that are telocentric or nearly so and 20 microchromosomes (Becak, 1965, 1968). Thus, a phylogenetic tree based on chromosome number and morphology would differ widely from the usual one in which Xenopeltis is placed in a monotypic family and the "boas" (Boa, Corallus, Epicrates, Eryx, Eunectes) are placed in a family or subfamily separated from that of the "pythons" (Python).

The low mitotic activity observed in this culture may be attributed in part to undernourishment or some other malady. The animal was received in the laboratory two months before it was processed; we know nothing of its care prior to that. It refused food in our laboratory and died approximately three weeks following cardiac puncture. We do not attribute the snake's death to the blood sampling because numerous other animals so sampled, including those sampled considerably earlier, show no ill effects, and this individual showed obvious symptoms of disease.

Similar cultures of whole blood from healthy snakes, however, often produce little better results. Thus, perhaps this technique is best used only in those cases where the continued life of the snakes is required for purposes of higher priority. One cannot help but wonder whether the sparse mitotic activity observed in these experiments reflects the reason that many investigators of reptilian karyotypes (and others) do not include statements on sample size in their reports, and in part why snake karyotypes appear to be relatively extremely conservative.

ACKNOWLEDGMENTS

We are grateful to Itzchak Gilboa for assisting in the care of the snake and in obtaining the blood sample from it, and to him and Richard G. Zweifel for criticizing the manuscript.

UNREVIEWED-UNEDITED COMMUNICATIONS

Relationship of the Neotropical Snakes *Hydrodynastes bicinctus* and *Cyclagras gigas*

Herndon G. Dowling & Frances W. Gibson

In a recent paper Peters (1970) reviewed the nomenclature of the two species of South American colubrid snakes that have variously been placed in the genera *Cyclagras*, *Dugandia*, *Hydrodynastes*, and *Lejosophis*. He determined that Hoge's previous review (1958) had been based in part on incomplete or erroneous information, and that the species originally named *Xenodon gigas* Dumeril (1893: 479, pl. 1), should be called *Cyclagras gigas*, rather than *Lejosophis gigas* as indicated by Hoge. Both authors agreed that the other species should be known as *Hydrodynastes bicinctus*. These names are used in the later paper by Peters & Orejas-Miranda (1970: 78, 127).

Peter's appears to have interpreted the nomenclature correctly. The result, however, is to maintain the separation of two similar snakes in monotypic genera. We wish to point out the apparent relationships of these two species.

Both are large, rather stout-bodied snakes with small eyes that have round pupils (Fig. 1). Their color patterns are similar, paired

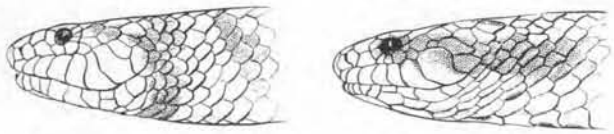

FIG. 1. Heads of *Hydrodynastes bicinctus* (AMNH 60822) and *Cyclagras gigas* (AMNH 60031). Note common presence of suboculars.

black crossbands on a light brown background. The overall appearance is so close that the two species are often confused in collections, and both are known as "South American Water Cobras" to commercial snake dealers.

Some of the basic information is given in tabular form (Table 1). Except for the presence of apical pits in *C. gigas* and their absence in *H. bicinctus*, the scutellation is virtually identical. The two species agree in such unusual features as the presence of suboculars, as well as in more general ways. The maxillary dentition is similar, dicrantarian with two enlarged teeth posterior to the diastema (Fig. 2), as are the other features of dentition and osteology. The hemipenes are similar in all important respects (Fig. 3).

APICAL SCALE PITS. Evidently these two species have been maintained in different genera mainly because of Boulenger's (1894) major reliance on the "key character" of apical pits. Because *H. bicinctus* lacked them, it was placed in his composite genus "*Urotheca*."

Recent observation suggests that the presence or absence of apical scale pits is not a characteristic of high phyletic importance. Conant (1961) discussed its inconsistency among American natricines, Vincent Maglio (*in litt.*) found it to be uncorrelated with other morphologic characters in West Indian colubrids, and Charles W. Myers (pers. comm.) found pits to be present in some individuals of certain species of *Rhadinaea* but absent in most.

TABLE 1

SELECTED FEATURES OF TWO COLUBRID SNAKES

FEATURES	H. BICINCTUS	C. GIGAS
Size	Large (2m+)	Large (2m+)
Proportions	Stout	Stout
Scutellation		
Head Scutes	Normal	Normal
Suboculars	Present	Present
Dorsals	Smooth	Smooth
Apical Pits	Absent	Present (2)
Rows	19-21	19
Reduction	Paravertebral	Paravertebral
Ventral Scutes	168-192	153-170
Anal Scute	Entire	Entire
Subcaudals	Paired	Paired
Number	69-94	60-87
Maxillary Teeth	Dicrantarian	Dicrantarian
Number	12-13 + 2	16-17 + 2
Hemipenis		
Form	Bilobed	Bilobed
Type	Subcapitate	Subcapitate
Sulcus	Bifurcate	Bifurcate
Chromosomes (2n)	24	24

DENTITION & OSTEOLOGY. The skulls of *H. bicinctus* and *C. gigas* show no unique features (Dumeril, 1853: pl. 1; Jan & Sordelli, 1881: pl. 2). Both have relatively small nasal bones and large supratemporals and quadrates. The skull of *H. bicinctus* appears to be somewhat more massive, with slightly longer supratemporals. The maxillary dentition is dicrantarian in both (Fig. 2), with *C. gigas* having more pre-diastemal teeth, 16-17 versus the 12-13 in *H. bicinctus*. The vertebrae are essentially identical.

FIG. 2. Maxillary bones and dentition of *Hydrodynastes bincinctus* (AMNH 60798) and *Cyclagras gigas* (AMNH 64899).

HEMIPENIS. The observations on the hemipenes were not made on ideal material. Both specimens were everted from individuals that had been long-preserved with the hemipenes in the inverted position. Such conditions are more likely to suggest differences through artifacts of preparation rather than similarities, however.

Both are bilobed hemipenes with bifurcate centrifugal sulcus. As pointed out by Neill (1964: 197), therefore, *H. bicincta* is definitely "xenodontine" rather than "colubrine," as supposed by Dunn (1944: 70). The

lobes have papillate calyces and the basal portions are spinose. We call them "subcapitate" because, whereas the capitulum is distinct on the asulcate side, it is much less so on the sulcate surface, appearing to be interrupted by the two branches of the sulcus and the intervening space.

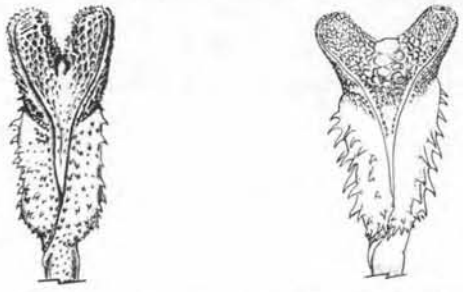

FIG. 3. Everted hemipenes of Hydrodynastes bicinctus (HGD 551) and Cyclagras gigas (HGD 565). That of H. bicinctus has smaller and more numerous spines; most of the other apparent differences are due to accidents of preparation.

The hemipenes differ in a few respects. The apparent difference in the spreading of the lobes is undoubtedly an artifact of preparation. The differences in length of four subcaudals (11 in H. bicinctus, 15 in C. gigas) may be a real difference, or may also be an artifact. However, the organ of H. bicincta does have smaller and more numerous spines, a relatively minor difference.

KARYOLOGY. Though chromosome counts are known for only about 50 colubrid species (Becak & Becak, 1969), we believe the agreement of these two species in chromosome number to be an important indication of close relationship. The diploid number of 24 is the lowest number reported in the Serpentes, and is shared with no other species (the nearest are species within the genera Erythrolamprus, Liophis, and Philodryas, all of which have 28). Further, as described and illustrated (Becak & Becak, 1969: 252, fig. 10-11), the karyotypes are virtually identical in the two, differing only in whether Chromosome 8 is metacentric (C. gigas) or submetacentric (H. bicinctus). Because Chromosome 8 is about at the limit of good resolution (1-2 micra), even this difference may be an artifact of observation.

SUMMARY & CONCLUSIONS

We believe that the identity or great similarity of H. bicinctus and C. gigas in body size and form, color and pattern, scutellation, dentition, hemipenis, and karyotype discounts the importance of apical scale pits in one and their absence in the other. None of the other differences noted appear to be of more than specific value.

We suggest, therefore, that these snakes be placed in the same genus to indicate their evident close relationships (this allocation was anticipated by Becak & Becak, 1969). Thus, the name Cyclagras Cope (1885: 185) joins Lejosophis Jan, 1863, and Dugandia Dunn, 1944, in the synonymy of Hydrodynastes Fitzinger (1843: 25). The included species are H. bicinctus (Hermann, 1804: 276), the type-species, which ranges from Amazonian Colombia to the Guianas and Amazonian Brazil, and H. gigas (Dumeril, 1853: 479), which is known from Argentina, Brazil, and Bolivia.

We wish to thank C. J. Cole, I. Gilboa, and R. G. Zweifel for reading the manuscript. This is contribution No. 19 of the Genera of Reptiles Project, which is partially supported by the National Science Foundation (NSF-OSIS GN-707).

book review

THE TAILED AMPHIBIANS OF EUROPE. By J. W. Steward. 1969. David & Charles (Publishers) Ltd., South Devon House, Railway Station, Newton Abbot, Devon, England. 180 pp., 13 plates, 29 drawings, text figs. 1-5, 16 maps. 42 shillings (= $5.04).

This work coming into print so soon after the appearance of Robert Thorn's "Les Salamandres d'Europe, d'Asie, et d'Afrique du Nord", leads naturally to a direct comparison between the latter and the work here reviewed. The advantages of Steward's book are that it is much cheaper ($5.04 versus $17.10 for Thorn's), and it is in English. However, the content of "Les Salamandres. . ." is superior, Thorn having included all the essential synonymies, a more detailed and scientific description of each form, and useful usable keys in contrast to the Steward book.

Some disappointing facets of "The Tailed Amphibians of Europe" are, for example, the following misleading or incorrect statements: (1) "With few exceptions they [Order Caudata] are born of eggs laid in water, pass through an aquatic larval state. . .etc."; his "few exceptions" constitute more than half of the living salamanders of the world [all members of the tribes Plethodontini and Bolitoglossini of the family Plethodontidae undergo direct development; these make up 161 of the 309 salamander species]. (2) "Plethodontidae - over 50 species. . ." whereas, there are currently 190 species recognized.

No explanation is given for the inclusion of Hynobius keyserlingii and exclusion of Mertensiella and Neurergus of Turkey and adjacent countries; the latter two genera range closer to (or as close to) continental Europe than does the former species. Inexplicably, he does show the ranges and gives accounts of some subspecies of Triturus and Salamandra in Turkey.

There is much useful information concerning food, habits, and habitat, as well as general descriptions of each European salamander covered. The photographs, drawings and figures are mostly excellent, so most herpetologists will want to add this work to their library.

reprints

NEW FACSIMILE REPRINTS

Anatome Testudinis Europaeae by L. H. Bojanus. A facsimile reprint of this classic in turtle anatomy was issued by the SSAR in February 1970. Originally issued in an edition of 80 copies at Wilna, Lithuania, in 1819-1821; 250 pages, 41 plates (folio). The reprint includes an introduction by Alfred S. Romer. Prices to SSAR members, $13.00 paperbound, $15.00 cloth; price to institutions and non-members, $18.00 and $20.00 respectively.

* * *

Sowerby and Lear's Tortoises, Terrapins and Turtles, although first issued in 1872, remains the finest atlas of turtle illustration ever produced. In addition to 60 8 1/2 x 11-inch plates, the reprint will include an introduction by Ernest Williams which brings the nomenclature up-to-date. Prices to individuals $9 paperbound, $10 clothbound; institutions, $14 and $15, respectively. To be issued fall 1970.

* * *

Camp's Classification of Lizards, the foundation for modern lizard systematics, has long been out-of-print. The reprint will include a preface by Charles L. Camp, an introduction by Garth Underwood analyzing Camp's work in view of recent research, and an index. Prices to individuals $11 paperbound, $12 clothbound; institutions $16 and $17 respectively. To be issued winter 1970-1971.

* * *

Books may be ordered from Dr. Henri C. Seibert, Publications Secretary, SSAR, Department of Zoology, Ohio University, Athens, Ohio 45701, U.S.A. A pricelist of other Facsimile Reprints in Herpetology, as well as other Society publications, may be obtained upon request.

PAUL J. YUHAS (429 Robins Street, Roselle, New Jersey 07203) would like to obtain specimens of the "western forms of Ambystoma tigrinum (mavortium, diaboli, etc.)."

CHARLES J. COLE (Dept. Herpetology, American Museum of Natural History, New York, N. Y. 10024) is particularly anxious to receive any living representatives of snakes of the Tantilla planiceps complex, which would be instrumental for the revision of that group being conducted jointly by him and Laurence M. Hardy (Dept. Biol. Sci., Louisiana State U, Shreveport, La. 71105).

We regret to inform you that our colleague

F. J. MITCHELL

Senior Curator of Vertebrates,
died on 23rd February, 1970.

SOUTH AUSTRALIAN MUSEUM

(A postcard received 8 May 1970)

ADVICE TO AUTHORS

Herpetological Review publishes feature articles that pertain to amphibians and reptiles, the people who study them, and the relevant societies and institutions. It is not intended as an outlet for reporting the results of research on these animals (but see "Unreviewed-Unedited"). Articles describing (and/or photographs illustrating) rarities, expeditions, laboratories, societies, museums, and historical articles that pertain to herpetological study are especially welcome. We would also appreciate news for the various Departments.

FORMAT. Manuscripts should be typewritten on white bond paper. All material, including legends for figures and literature cited, is to be double-spaced. Scientific names of genera and species are underlined. Titles should indicate clearly the subject and animal group(s) included. Use standard abbreviations for journals. See the special instructions for "Unreviewed-Unedited Communications."

The following publications will be of assistance in the preparation of manuscripts:

Catalogue of American Amphibians and Reptiles (Herpetological Catalogue Committee, American Museum of Natural History, New York, N. Y. 10024). $16.

Common names for North American amphibians and reptiles (Copeia 1956(3):172-185).

Scientific Writing for Graduate Students, by F. Peter Woodford (Rockefeller University Press, New York, N.Y. 10021). $5.75.

Biological Abstracts List of Serials with Title Abbreviations (BioSciences Information Service, 2100 Arch Street, Philadelphia, Pennsylvania 19103). $10.

Style Manual for Biological Journals (American Institute of Biological Sciences, 3900 Wisconsin Avenue, NW, Washington, D.C. 20016). $3.00.

ILLUSTRATIONS. The author's name, abbreviated title of the manuscript, figure number, and the notation "Top" should be penciled lightly on the back of all illustrations. Number the captions consecutively and list these on a separate page.

Line-cuts are photo-offset directly with the text, and should have widths of 4.4 inches (one column) or 9.3 inches (two columns). Each inch of illustration length equals six lines of text (full page copy length is 13.1 inches). Line cuts are reduced 25 per cent in processing.

Photographs and drawings reproduced by half-tone plates are handled separately but should be planned for one-column or two-column reproduction.

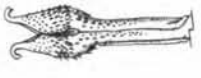
A publication that will be found helpful in planning and producing adequate illustrations is:

A Handbook for Biological Illustration, by Frances W. Zweifel (University of Chicago Press, Chicago, Illinois). $1.95.

PROOFS AND SEPARATES. Proofs will be sent to each contributor. Author's separates are made available at reasonable rates, and may be ordered when proof is returned.

UNREVIEWED-UNEDITED COMMUNICATIONS

"Unreviewed-Unedited Communications" is intended for single-subject notes of original observations, preliminary reports, or new ideas on amphibians and reptiles that can be presented in a maximum of two printed pages. Notes on anatomy, behavior, embryology, geographic distribution, physiology, or similar subjects are acceptable. It may be used also for speculations on phylogeny or comments on nomenclature. It is NOT to be used for the description of new taxa.



Because the reviewing and editing processes typical of journal publication are omitted, this section offers a rapid, inexpensive, and relatively-uncensored route of publication. Submission-time to publication-time is two to three months.

These articles will enter the scientific literature on amphibians and reptiles. Authors should list three to six index terms that indicate the limits of subject-material, geography, and included taxa.

The absence of the usual checking mechanisms of the ordinary publication process makes it doubly important that the author write clearly and that he review the manuscript carefully for typographical errors before submitting it. In no other form of publication is the author so clearly responsible for the content and presentation of his work.

This section is supported entirely by its authors and their sponsors. Page charges pay the costs of publication, distribution, and 100 author's reprints. Illustrations may be included but must be reduced to proper dimensions (see Advice to Authors).

Page charges are: $20 for a single page (155 lines of 40 characters and spaces); $40 for the two-page maximum (313 lines). Include an allowance for the title, and four lines for the author's name and address. [Send check for proper amount with manuscript.]

herpetological REVIEW

VOLUME 2, NUMBER 1

MARCH 1970

After Homo sapiens what?

"Some 300 generations have passed since man began a new life, tilling the earth and settling in villages. Now, within a single generation, man will become an urban species, with over half of the six billion persons in A.D. 2000 living in hivelike cities. Thus may end the 30,000-year span of *Homo sapiens* and begin the era of *Homo convivens*, a new communal species that would control its reproduction and manage its ecosystem — the biosphere."

Is Homo sapiens dead?

This dramatic new look at human evolution appears in a 32-page report on mankind from the January issue of *Natural History* Magazine. It's called "The State of the Species." Its pages span the ages of man from his beginning four million years ago to his future here on earth.

"Only by exploiting his mind, his one major evolutionary asset, can man overcome the urgent crises of our age."

Its six articles, written by leaders from various fields of research, contain some surprising remarks about man's origin, fertility, constraints and his unbeatable barrier, the space beyond his biosphere. Samples:

- **Man's cultural heritage may be two million years older than many scientists project (from an anthropologist with a new theory on human evolution)**
- **Man had better be content with life on earth because he's not going to be able to live in outer space**
- **Waste — not population growth — causes pollution**
- **People starve when they can have food (from the most comprehensive study on malnutrition to date, not yet published)**
- **One billion more people in 15 years (United Nations projections of world-wide growth in five-year intervals to 1985)**
- **The changing Chinese: birth rate declining, contrary to popular opinion**

This report is different, unusual, provocative reading. Like *Natural History* Magazine.

And it's yours free if you subscribe now to *Natural History*. (In addition to 10 issues of *Natural History*, you get two free books a year, and a membership in The American Museum of Natural History at no additional charge, which allows you to receive members' book and gift discounts.)

"Man has, for the past two centuries, disproved Malthus."

You might call *Natural History* a "think-in." Published by The American Museum of Natural History, its purpose is to revolutionize coverage of what's going on in the "natural" world. Much of the magazine will never be reported elsewhere in the press.

Its scope: the universe. It looks at man and other things, the land, sea and upward into the skies to the most distant galaxies.

Adventure of a different kind

Or you could call *Natural History* a different kind of adventure magazine. Because one of man's greatest adventures is the exploration of his self and the world around him, his past, his present, his possible future.

Today the problems of "nature" are taking a healthy chunk out of the national budget. *Natural History* is concerned not only about damage to the ecosystem but also about a realistic search for practical solutions. For example, in its February issue, which you will receive if you subscribe now, is a proposal to make pollution of Lake Champlain "pay off."

Diversity is the name of the game this magazine plays, so expect a surprising range of material. Margaret Mead on the possibility for survival. Christmas in the Kalahari desert. How the Soviet plan to transform nature. Getting along with a grizzly. The vital importance of properly "aging" our water supply. Life and death in the seal harems of Alaska. The most celebrated dog case ever tried in Johnson County, Missouri or the world. Initiation rites in New Guinea.

Full color photographs capture the drama of this reportage.

Every month there's "Sky Reporter," with celestial events charted by Dr. Thomas D. Nicholson, formerly head of the Hayden Planetarium and now Director of The American Museum of Natural History. Here is an easy introduction to stargazing along with fascinating facts about astronomy.

"It has recently become popular to ask those concerned with degradation of the environment whether it might not be best if they spent their time beating the drums for contraception."

Keep up with what's going on in the "natural" world

10 issues of *Natural History*. Two free books: the editors' spring and fall selections. Membership in The American Museum of Natural History and members' discounts on book and gift orders and preferred visitor's reception at the Museum. And that special bonus, "The State of the Species."

For only $7.

EDITORIAL

There are a number of new features in this issue of HERPETOLOGICAL REVIEW. They all have the same aim: to provide a medium of intercommunication between the people who have, as a common bond, an interest in amphibians and reptiles, but whose precise interests and approaches are widely different. Besides the professional herpetologists, there are ecologists, embryologists, geneticists, physiologists, and other professional biologists who utilize amphibians and reptiles (or, perhaps one amphibian or one reptile) in their studies. In addition, there are many people who are interested in these animals as part of the local fauna, or as pets. Much of the knowledge that is common to the membership of one of these separate fields is unknown to the others.

Workers in a field not only need to know what their fellows are doing, but also what is going on in allied fields that might affect their work and interests. A newsletter that would be common to the many diverse groups and societies might solve this problem. I propose to make HERPETOLOGICAL REVIEW this newsletter.

There are a number of approaches to intercommunication. One that was previously initiated is the CURRENT HERPETOLOGICAL TITLES section, which lists articles from all these fields. You will note that "Titles" is printed as a center section in this issue, making it possible to remove it without damaging the remainder of the publication. If we make HERPETOLOGICAL REVIEW a bimonthly publication, the "Titles" list will be of modest dimensions, and easier to scan.

The MEETINGS AND SOCIETIES and the INSTITUTIONS AND INDIVIDUALS sections are designed to let people know what their fellows are doing and what options are open to them in terms of meetings, courses, and other activities. BOOK REVIEWS and the advertisements of books and products serve similar functions. CONSERVATION is also a field that is obviously of common interest, and is included here as a separate section. A LETTERS section has been available to only a minority (e.g., members of the International Turtle and Tortoise Society). One is included here to give a place for an individual to express himself in regard to the activities of other workers.

The most exciting section to me (though it may cause some controversy) is a proposed UNREVIEWED-UNEDITED COMMUNICATIONS section. The SSAR has been a prime innovator in the field of information dissemination. It seems only right that it should initiate this new form of rapid communication. -- HGD.

LETTERS

[LETTERS concerning articles in this publication, the Journal of Herpetology, Copeia, Herpetologica, or other journals, will be published without editorial intervention if deemed to be of interest. HGD.]

A comment on: A NEW SUBSPECIES OF THE TURTLE GRAPTEMYS NIGRINODA CAGLE. By George W. Folkerts and Robert H. Mount. 1969. Copeia 1969(4):677-682, 6 figs. -- -- While critical comments on subspecific descriptions are seldom seen in the literature there arises the time when such comment seems to be warrented. Messrs. Folkerts and Mount have seen fit to add to the already vast list of subspecific epithets in zoology yet another trinomen. This alone is sufficient reason to raise the hackles of some systematists, but apart from the debate regarding the reality of the subspecies, the legality of the concept has long been upheld (Stoll et al., 1964).

Taxonomy is best served when the application of the subspecies concept is done judiciously. A recent comment on the recognition of the subspecies is worth noting here:"...a subspecies should be described only when to fail to do so would obscure more biological truths than would be lost by describing the subspecies" (Jameson, Mackey, and Richmond, 1966). With this in mind it is worth looking at the criteria that the authors have used in the diagnosis of their subspecies.

Folkerts and Mount distinguished Graptemys nigrinoda delticola from the nominate form on the basis of the following characteristics:"...a complex extensive dark plastral pattern, expanded along borders of plastral sutures, and occupying more than 60% of plastral area; postorbital mark neither crescent-shaped nor strongly recurved laterally, often disconnected from narrow longitudinal light stripes on head; soft parts mostly black; whitish or light yellow longitudinal stripes much narrower than black interspaces; shell relatively higher than in nominate subspecies".

Although superficial, these characters could be indicative of this population's unique adaptation to a particular set of environmental conditions present in its part of the range. Indeed, when a species geographic variation is such to produce a regional tendency that reflects adaptation unique to a particular region it may be worth noting by the use of the trinomen. Unfortunately, Folkerts and Mount have failed to show that delticola has any clear-cut sets of characteristics which are peculiar to the region which it inhabits.

According to the authors, the "intergrades" between nigrinoda and delticola have a plastral pattern covering 30-60% of the plastron while the nominate form has up to 30% of the plastron patterned. The color of the soft parts of the "intergrades" is intermediate between that of nigrinoda and delticola. They also state that the other characteristics are intermediate between the two subspecies. A figure purporting to support their claim that shell height is relatively greater in the newly described form is presented, but all it shows is a north-south cline in relative shell height. No attempt was made by the authors to test the validity of their claim.

Because the populations of Graptemys nigrinoda are sympatric and because of the existance of extensive areas of "intergradation", many times greater than the range of the proposed subspecies, it seems improbable that "well-defined" geographic races have developed. Might not this be a sampling artifact due to inadequate representation from the intermediate areas?

The phenomenon that the authors are dealing with seems to be a typical example of geographic variation which is manifested in the presence of several north to south clines. That the authors have failed to demonstrate any "steps" or breaks in the clines is quite clear. That they have presented no support for the naming of a subspecies is very evident.

A thorough study of geographic variation seems to be in order before the status of the populations of Graptemys nigrinoda is clear lest biological truths be obscured.

THE ECONOMICS OF HERPETOLOGICAL PUBLICATION

By Herndon G. Dowling

Until recently, like most herpetologists I had never been greatly involved in the economic aspects of publication. As chairman of the ASIH Herpetological Catalogue Committee, I was strongly and directly involved in 1969, however, when the printer unexpectedly raised the cost of printing the "Catalogue of American Amphibians and Reptiles" from a long-standing $23.50 per page to a steep $60 per page. Again, I was directly involved when the executive committee of the Herpetologists League recently found it necessary to raise the dues of that organization some 60 per cent merely to allow the addition of a half-time editorial assistant.

I mention these examples, not to imply any expertise in the field of publication economics, but to point out the dilemma posed to such organizations by current economic pressures. These pressures are bringing to light the amount of uncalculated (and often unknown and unappreciated) support that is offered these societies by various individuals and institutions.

It had never been brought home to me before the recent AAAS meetings in Boston (26-31 December 1969) that the major publishing costs are incurred prior to the actual printing and distribution of the journal -- and that this, in turn, is only a small part of the overall cost of producing a scientific paper. The Institute of Physics, for example, has calculated that the research for the average research paper costs $60,000, whereas the publication of the paper runs to only about $600. Even if you assume that zoologists come a lot cheaper (say $20,000?), there is still a lot of money tied up in a paper.

The physicists calculate an average production of one page per physicist per year. Whether herpetologists are any more prolific is hard to say. Some are, but I know a lot of herpetologists [some with big grants, too] who produce next to nothing.

Publication costs are somewhat easier to get at, but the greatest portion -- costs of editing, reviewing, etc., are so scattered among various individuals and institutions that donate these services that they are largely ignored. It is only when the chips are down that they have to be taken into consideration.

These hidden costs of editorships are so great that I doubt that most individuals and institutions would so freely assume them if they realized the true extent of the contribution. Few realize that an ordinary article passes through the editor's hands seven times before publication (Fig. 1). Ordinarily each such "pass" means at least one reading,

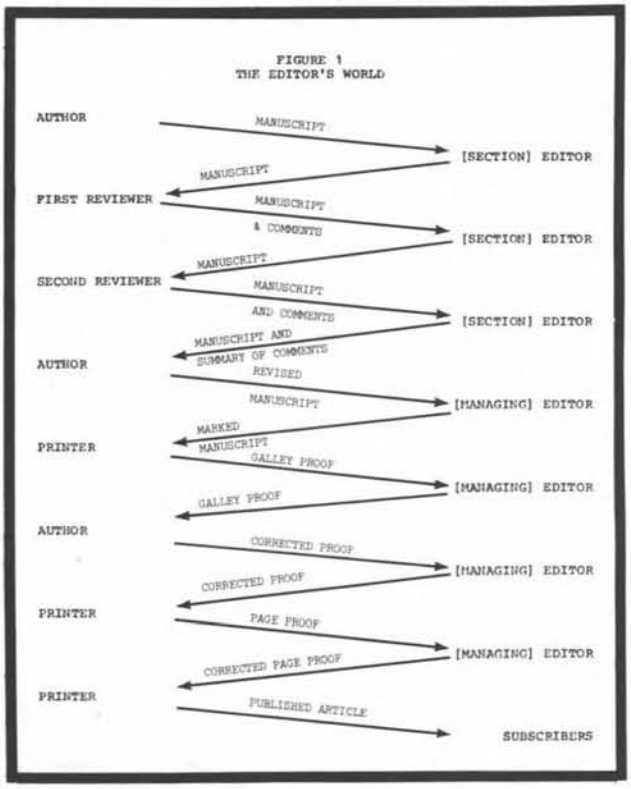

FIGURE 1. A well-written manuscript requires less work than a poor one, but a great deal of handling is involved in either case.

and often considerable correction, revision, and correspondence as well.

The actual costs of a small herpetological journal (falling, say, between Herpetologica and the herpetological part of Copeia) are estimated here (Table I). Listed in this way, the "hidden" costs of editing and reviewing ($12,750) are seen to exceed considerably the usual "publication costs" (composition, engraving, printing dist-ribution) of $8,900 that are commonly assumed by society members.

If the subscribers in the example pay only for the usually-recognized costs of publishing and distribution, then subscription rates will run about $6 ($8,900/1,500 subscribers). The addition

of any of the other real costs will raise this substantially, however ($2 per subscription, just to pay for the editorial assistant), and if subscribers were asked to pay all costs the subscription rates would be about $14.50 ($21,650/1,500). Keep in mind that these are publication expenses only. Any other society activities would require additional support.

An interesting comparison is provided by the American Institute of Physics, that publishes some 87 per cent of all physics papers that appear in the United States -- -- some 80,000 pages per year [20 feet of shelf space]. In this highly-organized and efficient operation (see also Table II), the pre-printing costs are precisely what I calculated for a herpetological journal: $54 per page [does this mean that my estimates are too low?]. The printing and distribution costs are a little higher, ($24 versus $18), but there are thousands more subscribers.

TABLE I
COSTS OF JOURNAL PUBLICATION

EDITORIAL OFFICE		
Editor (half-time, 12-month basis).....	$8,000	
Editorial Assistant & Secretary (half-time)...	3,000	
Postage, telephone, printing, etc.....	500	
		$11,500
REVIEWERS		
Acceptable manuscripts (100 @ $10)...	1,000	
Unacceptable manuscripts (50 @ $5).....	250	
		1,250
PRINTING PREPARATION		
Composition (300 pages @ $10).....	3,000	
Engravings (50 @ $10).....	500	
		3,500
TOTAL PRE-PRINTING COST		$16,250
PRINTING		
Two thousand copies of 300 pages @ $15.....	4,500	
DISTRIBUTION		
Quarterly issues to 1,500 subscribers ($0.15/copy x 4 issues = $0.60 per subscriber x 1,500).	900	
TOTAL OF PRINTING AND DISTRIBUTION		5,400
TOTAL COST OF JOURNAL PUBLICATION..		$21,650
SUMMARY: Pre-printing cost per page.....	$54	
Printing-distribution per page.....	18	
TOTAL COST PER PAGE.....	$72	

The cost of the editor's office was taken from estimates made by one such editor. They correspond closely to estimates made from personal observation.

Reviewer's time is calculated at $10 per hour, with an assumption that review of a manuscript requires one-half hour. Tentatively "acceptable" manuscripts require two reviewers, definitely "unacceptable" manuscripts only one.

Even if distributed among many subscribers, the $78 page cost would make for rather high-priced journals. The Physics Institute does not expect subscribers to pay the full cost, however. Instead, page-charges of $60 are levied on the authors (and their sponsors), who thus pay the entire pre-printing costs; subscribers pay only the much lower printing and distribution costs. Though payment of the page-charges is "optional," the rate of return is kept at near the 90 per cent level (90% of $60 = $54 = actual cost) by the threat of delay in publication.

It is my impression that the costs of inflation (as reflected in the higher costs of materials, personnel, and services), the tighter grant situation, and the more explicit cost-accounting demanded by many agencies, will require the calculation of all these costs soon by all scientific societies -- and probably the payment of them as well. Page-charges are supported by granting agencies, and by some other institutions, and seem to be one promising alternative to rapidly rising subscription rates. However, the small page-charges calculated for Copeia ($20) and Herpetologica ($17) are inadequate, even when the societies depended heavily on the donated work and services of individuals and institutions. The values -- and costs -- of scientific publication have been underrated too long.

TABLE II
APPROXIMATE NUMBER OF CHARACTERS AND SPACES PER PAGE OF TEXT IN DIFFERENT JOURNALS

Herpetologica.....	2,800
Journal of Herpetology.....	4,500
Copeia.....	4,700
Herpetological Review*.....	5,800
PHYSICS JOURNALS.....	6,000
Catalogue of American Amphibians and Reptiles.....	9,600

Differences in content and format must be included in calculating true publication costs.

* Included for comparison only.

UNREVIEWED-UNEDITED COMMUNICATIONS

This section is supported entirely by its authors and their sponsors. Page charges pay the costs of publication, distribution, and 100 author's reprints. Illustrations may be included but must be reduced to proper dimensions (see Advice to Authors, p. 32).

Page charges are: $20 for a single page (134 lines of 42 characters and spaces); $40 for the two-page maximum (272 lines). Include an allowance for the title, and four lines for the author's name and address. [Send check for proper amount with manuscript.]

"Unreviewed-Unedited Communications" is intended for single-subject notes of original observations, preliminary reports, or new ideas on amphibians and reptiles that can be presented in a maximum of two printed pages. Notes on anatomy, behavior, embryology, geographic distribution, physiology, or similar subjects are acceptable. It may be used also for speculations on phylogeny or comments on nomenclature. It is NOT to be used for the description of new taxa.

Because the reviewing and editing processes typical of journal publication are omitted, this section offers a rapid, inexpensive, and relatively-uncensored route of publication. Submission-time to publication-time is two to three months.

These articles will enter the scientific literature on amphibians and reptiles. Authors should list three to six index terms that indicate the limits of subject-material, geography, and included taxa.

The absence of the usual checking mechanisms of the ordinary publication process makes it doubly important that the author write clearly and that he review the manuscript carefully for typographical errors before submitting it. In no other form of publication is the author so clearly responsible for the content and presentation of his work.

The idea of an unreviewed-unedited publication was suggested to me by F. Peter Woodford, of Rockefeller University, in an informal conversation at the recent AAAS meetings in Boston. He presented a paper on this subject in one of the sessions.

The basic concept of unreviewed-unedited publications is that there are many workers who have bits of information or ideas that would be of value to someone who is working on a specific problem. At the same time, the information may seem too trivial or too far from the possessor's main line of research for him to expend the time and effort necessary to expand the item into a major paper. Though some of this information is passed along informally in conversations, personal letters, etc., there is no assurance that it is available to (perhaps) the one person who might need it most. Further, the source of such informal information is easily lost or forgotten, leading to questions of authorship, date of origin, and the availability of original data.

These questions are resolved when there is a recognized publication in a field in which an author may record his ideas and information and thus assure their broad dissemination to fellow workers.

There is no reason for such informational articles to be subjected to the long and costly process of reviewing and editing that is necessary for journal articles. In fact, these procedures interfere with the rapid dissemination that is one of the greatest values of such notes.

A publication that is produced by inexpensive photo-offset methods, that is the organ of a recognized scientific society, and that is NOT a scientific journal in the usual sense, is the ideal outlet for communications of this sort. Herpetological Review admirably fulfills all of these features. And, rather than such publication becoming an additional burden to Society finances, the author (or his sponsor) is asked to pay the costs of publication and distribution. The procedures outlined above allow these costs to be kept to a minimum.

The major objection to such a publication outlet is the fear that it might open the gates of publication too wide -- that certain authors might flood the publication with their ill-conceived ideas, or that uninformed workers might publish redundant material. I think it was James Peters observation, though, that in these times "any boy with a typewriter can start his own herpetological publication." Similarly, it is my observation that any persistent author can get his article published -- if not in Copeia, Herpetologica, or the Journal of Herpetology, at least in the journal of some academy of science or local journal.

Meanwhile, in "making the rounds," the article has cost the various societies uncountable hours of reviewer's and editor's time -- time that could be better spent elsewhere. And if the article does contain some worthwhile information, it has been withheld for months, perhaps for years, from those who might use it. The current system, then, tends more to delay and scatter information, rather than to repress its publication. I believe another approach is needed. Let us give "unreviewed-unedited" a try. -- HGD.

CURRENT HERPETOLOGICAL TITLES, IX: 1969

Herpetological Information Search Systems

* * * * *

This is the ninth list that contains titles of books and articles relating to the field of herpetology that were published since the initiation of our bibliographic project. The name of the project has been changed to more clearly indicate its present emphasis. The 706 titles listed here bring the total for 1969 to 2,300. The 1968 titles are continuing to come in! It may be that the final total for that year will approach 4,000.

Though we will continue to enter titles published in earlier years to our system, on the basis that two-year-old literature is no longer current, we will not publish these titles in forthcoming lists.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of some interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

Our present policy, then, is to list the title of any paper that is concerned with a member of a Recent order of amphibians or reptiles.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive. We have published 8,325 "Current Titles" since January 1968.

This ninth list contains titles of books and articles that have come to our attention during the period 17 October 1969 through 6 January 1970.

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and T. Shaman. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

Members of the Herpetology Department and the Library staff of the Museum have continued to aid our efforts. No commercial computer service yet offers all of the facilities that we need, however, and we continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We are grateful to all of these individuals and institutions for their help.

This is contribution Number 17 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

JOURNALS INCLUDED

Listed below are the 236 different journals (several issues of some) in which articles relating to amphibians and reptiles were found during this quarter. This list is intended, not only as a check-list of journals covered, but also as an indicator of the highly scattered nature of articles pertaining to these animals.

LYSTROSAURUS AND CONTINENTAL DRIFT

Ordinarily, few things herpetological would be of less interest to the student of Recent reptiles than the range extension of a Lower Triassic dicynodontian therapsid (Reptilia: Synapsida). But when the record is from Antarctica and the reptile is Lystrosaurus, an index-fossil of the South African Upper Beaufort beds, it is of interest to all.

The previously-described diverse Permian flora of Antarctica and the small piece of bone identified by E. H. Colbert as part of a jaw of a labyrinthodont amphibian (1968, Science 161(3840):460) were interesting in themselves, but hardly pertinent to the herpetogeography of Recent orders. However, Colbert's recent identification of Lystrosaurus among the remains of other reptiles and amphibians that his field party found at Coalsack Bluff in the Alexandra Range of Antarctica (N.Y. Times, 6 December 1969) points to a direct connection between South Africa, India, and this southern continent in the Lower Triassic. The as-yet-unstudied other animals may point to additional land connections.

Whether or not one accepts the entire theory of continental drift, this indication of southern intercontinental connection does provide some reasonable alternative to the tenuous "northern route" explanation of the presence of the ascaphid frog genus Liopelma and a rhynchocephalian reptile (Sphenodon) in New Zealand. Palacrodon (Rhynchocephalia: Sphenodontidae) inhabited South Africa during the Lower Triassic. And if Antarctica's connections with other continents persisted into the Jurassic, this could have affected the distributions of many other Recent orders. Frogs were well-established by the Middle Jurassic. Turtles are known from the Middle Triassic and the living genus Trionyx is recognized in the Upper Jurassic. Lizards (Upper Triassic) and eosuchian crocodiles (Upper Jurassic), likewise, were present.

The resemblance of Australia and South America in their faunas of chelid turtles and leptodactylid and hylid frogs again gains prominance. And how about the pipid frogs of Africa and South America? Could they have arrived via an Antarctic connection? And could such a connection have played some part in the faunal resemblance of Madagascar to South America (boas, iguanid lizards, and the side-necked turtle Podocnemis)?

It is too much to expect that the vision of a warm and continent-connected Antarctica will solve all of the problems of Recent reptile and amphibian geography. However, all students of these animal groups can feel especially grateful to Dr. Colbert for providing them with this new vantage-point now. This rigorous and far-fetched expedition (its basis a single scrap of bone) was taken in the year of his retirement from the American Museum. -- HGD. [Photo courtesy of AMNH. Dr. Colbert in his Antarctic laboratory.

GERMAN HERPETOLOGICAL SOCIETY

By Harry W. Greene
Eysseneckstrasse 12, Frankfurt am Main
West Germany

Established in 1965, the DEUTSCHE GESELLSCHAFT FÜR HERPETOLOGIE UND TERRARIENKUNDE is devoted to the study of all aspects of the biology of reptiles and amphibians. To this end the society arranges an annual convention, monthly meetings for local groups, provides a library service for European members, and publishes the journal Salamandra.

The journal is international in scope and should be of particular interest to American herpetologists. Printed on good quality glossy paper, Salamandra has an attractive format and excellent photographic reproduction. For the benefit of those who do not read German, each major paper is accompanied by an English summary and all figures have legends in both languages. The most recent issue (Vol. 5(1-2):1-80) contains articles on: an evaluation of the effectiveness of 13 insecticides in treating mite and tick infestations of captive reptiles and amphibians; techniques and results of amputation of the tail of Tiliqua scincoides; natural hybridization between Bufo calamita and B. viridis; courtship and mating behavior of Eryx johni; a new subspecies of Tupinambis teguixin from Isla dos Buzios, Brazil; observations on habitat selection by Testudo geometrica in South Africa; the rudimentary voice of B. bufo; distribution of Vipera aspis in Spain; a discussion of the herpetofauna of Tobago; and a note reporting a longevity record for Salamandra salamandra [43 years!]. In addition to these formal contributions, there are 53 short "Besprechungen" (abstracts) of recent herpetological papers and five reviews of new books.

Membership in the society is open to all interested individuals, groups, and institutions. Dues (including subscription to Salamandra) are DM 20 (about $5.50) a year plus an application fee of DM 2 ($.55). Back issues of the journal are available at reasonable rates. Send applications for membership (accompanied by international money order) and requests for additional information to the society president, Dr. Konrad Klemmer, at the Senckenberg Museum, Senckenberg-Anlage 25, 6000 Frankfurt am Main 1, West Germany.

MEETINGS AND SOCIETIES

CALENDAR 1970

25-28 March....SOCIETY FOR THE STUDY OF EVOLUTION, Silver Anniversary Meeting, Austin, Texas.

26-31 March....AMERICAN SOCIETY OF ICHTHYOLOGISTS AND HERPETOLOGISTS, Annual Meeting, New Orleans.

23-29 August....AMERICAN INSTITUTE OF BIOLOGICAL SCIENCES, Annual Meeting, Bloomington, Indiana.

27-30 August....SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES, Annual Meeting, Kansas City, Missouri.

26-31 December....AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, Chicago.

28-30 December....HERPETOLOGISTS LEAGUE, Annual Meeting (with AAAS).

The FIRST CENTRAL ASIAN CONFERENCE ON VENOMOUS ANIMALS AND THEIR VENOM met in Tashkent, Uzbek, S.S.R., 1-3 October 1968, under the auspices of the Uzbek Academy of Sciences. Some 157 persons representing 27 institutions in various cities and states of the USSR and its dependencies attended. This was the first attempt at wide discussion of problems concerned with the systematics, ecology, toxicology, and biochemistry of invertebrate and vertebrate venomous animals in the USSR. Both basic and clinical problems were discussed. A second conference is to be convened in 1970 or 1971. [Abstracted from a report by O. P. Bogdanov, 1969, Zool. Zhr. 48(3):463; translation by Robert Winter.]

The HERPETOLOGISTS LEAGUE held its annual meeting, in conjunction with the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, at the Statler Hilton Hotel, Boston, 28-29 December 1969. Twenty-five papers were presented -- five of these as joint papers with the AMERICAN SOCIETY OF ZOOLOGISTS Division of Vertebrate Morphology.

In spite of this joint presentation, a large number of conflicting presentations occurred during the simultaneous meetings of the SOCIETY FOR THE STUDY OF EVOLUTION, 27-30 December, and various other divisions of the ASZ. These and the ECOLOGICAL SOCIETY OF AMERICA presented a total of 54 papers dealing with amphibians

and reptiles. This presented herpetologists with such choices as "Species recognition among Southeastern hylid frogs," by H. Carl Gerhardt (SSE), "Comparative myology in the species of Batrachoseps," by Wilmer W. Tanner (HL), and "Systematic comparisons of American Frogs of the Family Microhylidae and the problems of consistency in anuran classification," by C. E. Nelson (SSZ) -- all held in the early afternoon of 28 December.

The SECOND INTERNATIONAL SYMPOSIUM ON ANIMAL AND PLANT TOXINS (and the Annual Meeting of the INTERNATIONAL SOCIETY OF TOXINOLOGISTS) was held in Tel Aviv, Israel, 22-28 February 1970. Some 100 participants from 22 countries were listed on the program. Most of the 55 papers of herpetological interest related to snake venoms and antivenins. However, such papers as "Distribution of venomous snakes in Israel," by H. Mendelssohn, "Snake locomotion," by C. Gans, "Lung reduction in some poisonous Indian snakes," by P. J. Deoras, and "On the toxin of Bombina variegata," by H. Michl emphasize that the Society has broader interests.

INDIVIDUALS AND INSTITUTIONS

ROBERT BOORD (morphology, U. Delaware) is on sabbatical, studying central connections of lateral line and acoustic nerves in amphibians. EDMUND D. BRODIE, JR. (frog ecology) moved to Clemson U., Clemson, South Carolina in September, 1969. JAMES L DOBIE (turtle morphology, Auburn U., Auburn, Ala.) "will soon describe a new dermatemidid turtle genus" from the Upper Cretaceous of Alabama. HARLOW K. FISCHMAN (snake chromosomes) moved to Opthalmic Research, College of Physicians and Surgeons, Columbia U., N.Y., as of September, 1969. JAMES MOULTON (morphology, Bowdoin C., Brunswick, Maine), among other things is taking "a new look at regeneration of amphibian limbs." Dr. & Mrs. MURRAY NEWMAN left for a two-and-a-half-month visit to Australia on 30 October 1969. They hope to collect some crocodiles for the Vancouver Public Aquarium on their visit. HERBERT ROSENBERG (morphology) has moved to U. Calgary, Alberta, Canada, where he is looking into feeding mechanisms of snakes and amphibian locomotion. Dr. HEINZ WERMUTH (reptile systematics) was inadvertently ommitted from the list of Sustaining Members of SSAR in a recent issue of Herpetological Review. WALTER AUFFENBERG (ethology, paleontology; U. Florida) is on Komodo Island (East Indies) for a year, investigating the status of Varanus komodoensis. GEORGE C. GORMAN (cytogenetics, U. California) will be at the Hebrew University of Jerusalem (Israel) for a year, studying chromosomes in Lacerta. And among the Queen's New Year's honors list was ERIC WORRELL, Australian herpetologist of New South Wales, who received the M.B.E. (Member of the Order of the British Empire).

There were several changes this Centennial Year at the AMERICAN MUSEUM OF NATURAL HISTORY. CHARLES M. BOGERT, longtime chairman of the Department of Herpetology, retired to Santa Fe, New Mexico. RICHARD G. ZWEIFEL (frog systematics) assumed the departmental chairmanship. CHARLES W. MYERS (snake systematics, from U. Kansas) and CHARLES J. COLE (lizard chromosomes, from U. Arizona) came in as assistant curators. Also, EDWIN J. COLBERT (reptile paleontology) retired from the Department of Vertebrate Paleontology (see story elsewhere in this issue).

At the U. S. NATIONAL MUSEUM publication of the "Catalogue of Neotropical Squamata" was announced by JAMES A. PETERS. It is to appear 20 February 1970: Part I, Snakes (341 p.) by Peters and BRAULIO R. OREJAS-MIRANDA, Part II. Lizards and Amphisbaenians (291 p.) by Peters and ROBERTO DONOSO-BARROS. The publication (Bull. U.S. Nat. Mus. (297)) is to have widespread distribution from an expanded mailing list of the Museum.

The AMERICAN MUSEUM OF NATURAL HISTORY announces the availability of grants from its THEODORE ROOSEVELT MEMORIAL FUND. These grants to "younger scientists," especially graduate students, may be used for travel and living expenses incurred in investigations on the North American fauna anywhere in the United States or Canada (including the Museum and its field stations). Write the Director of the Museum for additional information. Deadline for applications is 15 April.

The UNIVERSITY OF VIRGINIA announced that herpetology will be one of eight graduate field courses offered at the MOUNTAIN LAKE BIOLOGICAL STATION in the first term this summer (10 June - 14 July). Some NSF awards are available (application deadline is 1 May).

The JAPAN SNAKE INSTITUTE initiated its publication, The Snake, in August 1969. The first issue (vol. 1, no. 1) contains nine major articles, plus notes. The text is in Japanese; most of the articles have English abstracts. Articles mainly relate to venomous snakes but range from "Snakebites on Taiwan" to [unexpectedly] "A simplified method of the breeding of Xenopus laevis."

new books & reprints

SIERRA NEVADA AMPHIBIANS. By Harold E. Basey. 1969. The Sequoia Natural History Association, Inc., Three Rivers, California 93271. ii-iv + 27 pp., 17 color photographs (including cover picture), 1 fig. $1.45.

This booklet is an excellent popular regional guide and the color photographs are mostly of superb quality. The author organizes his work into the following sections: Introduction, What are amphibians, Interest in Sierran amphibians, Conservation, The Sierra Nevada, Where and when are amphibians observed, Courtship and mating, Eggs, The young, Metamorphosis, Ecology, Learning more about amphibians, Species accounts, Checklist and classification of Sierran amphibians, and a final back page for Field notes. Mr. Basey decided not to include two species accounts, Rana pipiens (Leopard Frog) and Taricha granulosa (Rough-skinned Newt), as they occur only at the periphery of the Sierra Nevada region.

The information presented is factual and easily readable by the layman. However, it was unfortunate that Mr. Basey's publication was in press at the time of the description of the Relictual Slender Salamander (Batrachoseps relictus) as this species, described in mid-1968, is represented in the photograph as the California Slender Salamander (Batrachoseps attenuatus). Also, the habitat description and activity periods given are largely for B. attenuatus. B. relictus occurs at higher elevations, generally 1500-8000 feet, occurs predominately under surface material at the sides of brooks, lays its eggs during the summer months, and is generally active most all year around.

It would have been useful if the author had included the scientific names below the common names. In only a few instances is the scientific name mentioned within the species account. However, the readers can refer to the checklist and classification of Sierran amphibians at the end of the publication for scientific names. In spite of the few drawbacks, I highly recommend this popular guide to herpetologists and any layman interested in amphibians or the Sierra Nevada.

NEW FACSIMILE REPRINTS

Anatome Testudinis Europaeae by L. H. Bojanus. A facsimile reprint of this classic in turtle anatomy was issued by the SSAR in February 1970. Originally issued in an edition of 80 copies at Wilna, Lithuania, in 1819-1821; 250 pages, 41 plates (folio). The reprint includes an introduction by Alfred S. Romer. Prices to SSAR members, $13.00 paperbound, $15.00 cloth; price to institutions and non-members, $18.00 and $20.00 respectively.

* * *

Sowerby and Lear's Tortoises, Terrapins and Turtles, although first issued in 1872, remains the finest atlas of turtle illustration ever produced. In addition to 60 8 1/2 x 11-inch plates, the reprint will include an introduction by Ernest Williams which brings the nomenclature up-to-date. Prices to individuals $9 paperbound, $10 clothbound; institutions, $14 and $15, respectively. To be issued fall 1970.

* * *

Camp's Classification of Lizards, the foundation for modern lizard systematics, has long been out-of-print. The reprint will include a preface by Charles L. Camp, an introduction by Garth Underwood analyzing Camp's work in view of recent research, and an index. Prices to individuals $11 paperbound, $12 clothbound; institutions $16 and $17 respectively. To be issued winter 1970-1971.

* * *

Books may be ordered from Dr. Henri C. Seibert, Publications Secretary, SSAR, Department of Zoology, Ohio University, Athens, Ohio 45701, U.S.A. A pricelist of other Facsimile Reprints in Herpetology, as well as other Society publications, may be obtained upon request.

A BIG YEAR FOR ALLIGATORS

The year 1969 would appear, at least on paper, to mark the turning point in conservation efforts to save the American alligator (*Alligator mississippiensis*) from almost certain extinction in the 1970's. Already, wildlife management personnel had reported reduction of Florida alligators to a fraction of their previous numbers: 10 per cent of their 1960 populations in Everglades National Park, ONE per cent in other areas.

The factors that had influenced this drastic decline had included the diversion of the normal flow of water from the Okeechobee region, the severe drought of the mid-sixties, and the "prevalence of people." The main reason, though, was the omnipresent hide-hunter. With the fashion world stimulating the use of alligator skin handbags ($275), shoes ($75), and even attache cases ($1,250), the price of raw alligator belly-skins attained a high of at least $10 per linear foot in 1969.

This meant that poaching really paid during the sixties. There are few other professions in which an uneducated man, with an investment of only a flashlight and a rifle (a boat is handy, but not essential), can earn $200 to $400 in a night's work. Even if the hunter was captured by the authorities in a place where the activity was blatently illegal (e.g., in the Park), and with light, rifle, and dead alligators in hand, it was still difficult to get a poacher convicted in the Florida courts. Or if he was convicted, the fine was set so low that another night's work would more than rectify the financial loss.

However, on 5 December 1969 President Nixon signed into law (Public Law 91-135) an Act "To prevent the importation of endangered species of fish or wildlife into the United States; to prevent the interstate shipment of reptiles, amphibians, and other wildlife taken contrary to State law; and for other purposes." This law (to become effective 180 days after the date of enactment) makes it illegal for anyone to import or to ship across state lines any animal or animal product which has been taken illegally, either in the United States or in a foreign country. Because Georgia was the last state within the natural range of alligators to make their killing illegal (in 1968), it is now made clear that ANY American alligator or alligator product is prohibited from importation or interstate commerce.

At about the same time, Mayor Lindsay of New York signed into law (Local Law 943-1124) a bill making it illegal for anyone to "possess for sale any American alligator object or American alligator" within the City (a fashion stronghold) after 1 July 1970. It also makes it necessary for importers to keep records of the origin of hides and that all products made from crocodilian skins be marked, "Not made from American alligator skin."

Added to the even more recent decision against the building of the Everglades jetport, the actions taken in 1969 would appear to offer adequate protection to those American alligators that survive until next July. Initially, these laws may bring more pressure by hide hunters on crocodilian populations in other parts of the world.

However, laws for crocodilian protection are appearing in what seemed to be unlikely places (see figure), and perhaps some of the "more civilized" countries will follow suit. Perhaps within the decade, the only crocodilian skins will come from animals that have been farmed for that purpose.

"1969 LAW ABOUT CROCODILES"

"Let the big crocodiles live.
You cannot sell the skins from
big crocodiles any more."
"You can sell skins of little
crocodiles, that is all."
[A New Guinea poster in Pidgin-
English and Motu.]

ADVICE TO AUTHORS

Herpetological Review publishes feature articles that pertain to amphibians and reptiles, the people who study them, and the relevant societies and institutions. It is not intended as an outlet for reporting the results of research on these animals (but see "Unreviewed-Unedited"). Articles describing (and/or photographs illustrating) rareties, expeditions, laboratories, societies, museums, and historical articles that pertain to herpetological study are especially welcome. We would also appreciate news for the various Departments.

FORMAT. Manuscripts should be typewritten on white bond paper. All material, including legends for figures and literature cited, is to be double-spaced. Scientific names of genera and species are underlined. Titles should indicate clearly the subject and animal group(s) included. Use standard abbreviations for journals. See the special instructions for "Unreviewed-Unedited Communications."

The following publications will be of assistance in the preparation of manuscripts:

Catalogue of American Amphibians and Reptiles (Herpetological Catalogue Committee, American Museum of Natural History, New York, N. Y. 10024). $16.

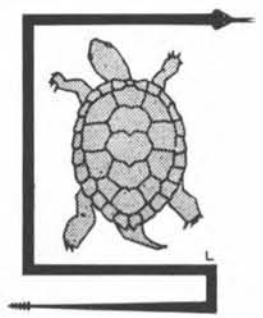
Common names for North American amphibians and reptiles (Copeia 1956(3):172-185).

Scientific Writing for Graduate Students, by F. Peter Woodford (Rockefeller University Press, New York, N. Y. 10021). $5.75.

Biological Abstracts List of Serials with Title Abbreviations (BioSciences Information Service, 2100 Arch Street, Philadelphia, Pennsylvania 19103). $10.

Style Manual for Biological Journals (American Institute of Biological Sciences, 3900 Wisconsin Avenue, NW, Washington, D.C. 20016). $3.00.

ILLUSTRATIONS. The author's name, abbreviated title of the manuscript, figure number, and the notation "Top" should be penciled lightly on the back of all illustrations. Number the captions consecutively and list these on a separate page.



Line-cuts are photo-offset directly with the text, and should have widths of 4 inches (one column) or 8 1/2 inches (two columns). Each inch of illustration length equals six lines of text. Line cuts are reduced 25 per cent in processing.

Photographs and drawings reproduced by half-tone plates are handled separately but should be planned for one-column or two-column reproduction.

A publication that will be found helpful in planning and producing adequate illustrations is:

A Handbook for Biological Illustration, by Frances W. Zweifel (University of Chicago Press, Chicago, Illinois). $1.95.

PROOFS AND SEPARATES. Proofs will be sent to each contributor. Author's separates are made available at reasonable rates, and may be ordered when proof is returned.

CATALOGUE OF AMERICAN AMPHIBIANS AND REPTILES

Accounts 81 - 90 of the Catalogue were published on 16 January 1970. These include:

81. Ambystoma mabeei. By Jerry D. Hardy and James D. Anderson.
82. Plethodon dunni. By Robert M. Storm and Edmund D. Brodie, Jr.
83. Plethodon vehiculum. By Robert M. Storm and Edmund D. Brodie, Jr.
84. Typhlotriton, T. spelaeus [Revised]. By Ronald A. Brandon.
85. Scaphiopus couchii. By Aaron O. Wasserman.
86. Rana sylvatica. By Bernard S. Martof.
87. Hemidactylus turcicus. By C.J. McCoy.
88. Coleonyx brevis. By James R. Dixon.
89. Coleonyx reticulatus. By James R. Dixon.
90. Sphaerodactylus notatus. By Albert Schwartz.

Another ten accounts are expected to appear by June 1970.

"CURRENT TITLES" ON LIBRARY CARDS

"Current Herpetological Titles," beginning with the 1969 literature, is available on standard library cards on a subscription basis. Abstracts are added to the titles when an abstract of sufficient brevity is published with the article. These have amounted to about one-third of the library cards published to date.

This new project of HISS is self-supporting with nine subscribers. Because of this small number, the subscription is rather costly: $250 for a single set of cards, $600 for three sets. However, this amounts to only 6 to 7 cents per card for the estimated annual issue of 3,600.

If we could gain another 100 subscribers, we probably could reduce the cost to within the financial capability of the individual worker. If you are interested, please write to H. G. Dowling at HISS indicating how much you are willing (or able) to pay for a subscription.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles.

SOCIETY DUES FOR 1969

Dues for calendar 1969 are: Regular member (U. S. and Canada) - $6.00; Foreign member - $5.00 (via international money order); Sustaining member - $8.00; Contributing member - $15.00; and Life member - $100.00. Institutional subscription is $10.00.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

REPORT ON SOCIETY'S 12th ANNUAL MEETING

The Society's Twelfth Annual Meeting was held 5-7 September 1969 at the Carbondale campus of Southern Illinois University. Ninety persons attended. Society Chairman N. Bayard Green opened the meeting by introducing Dr. Robert MacVicar, SIU Chancellor, who gave the welcoming address. Some two dozen papers were presented, including invited talks by William D. Schmid and Arnold G. Kluge on the application of special techniques to studies of amphibians and reptiles; abstracts of papers appear in Journal of Herpetology, vol. 3, nos. 3-4. Philip W. Smith, James E. Huheey, James C. List and James L. Vial presided over the paper sessions.

The Board of Directors met Friday evening; the following were present: N. Bayard Green, Joseph T. Collins, James C. List, J. P. Kennedy, R. E. Gordon, Lowell P. Orr and Ronald A. Brandon. Thirty-one items were discussed at the Board of Directors meeting. Some of the more important proposals passed were: 1) that Life membership dues be increased from $100. 00 to $150. 00 effective 1 January 1971; 2) that Herpetological Review be offered for sale as a back issue at $1. 50 per copy; 3) that abstracts of future papers presented at SSAR meetings not be published in the Journal of Herpetology; and 4) that Herndon G. Dowling (American Museum of Natural History) be appointed as the new editor of Herpetological Review effective 1 January 1970.

At the business meeting on Sunday, the proposed constitution was passed; this will be printed in Volume 4 of the Journal. In addition, the following resolutions were read by Resolutions Committee Chairman Lowell P. Orr:

WHEREAS, the Chancellor of Southern Illinois University, Carbondale, Dr. Robert MacVicar, in his remarks opening the 12th Annual Meeting of the Society for the Study of Amphibians and Reptiles, pointed out the recent cooperative activity between the Federation of American Societies for Experimental Biology and the American Institute of Biological Sciences in development of the American Biological Council, to speak with a united voice for the life sciences in the United States, and

WHEREAS, the Society for the Study of Amphibians and Reptiles views this union as a most progressive and needed step, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles go on record in support of this action and extend to the appropriate individuals its commendation for this forward step.

WHEREAS, Dr. N. Bayard Green has guided the Society for the past two years as its chairman with unusual efficiency and dedication, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles extend to him its utmost appreciation for a job well done.

WHEREAS, Mr. Joseph T. Collins has effectively served the Society for the Study of Amphibians and Reptiles as one of its most loyal and prodigious workers as secretary-treasurer and editor of Herpetological Review, and

WHEREAS, he has recently submitted his resignation for the latter position, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles express to Mr. Collins its profound appreciation for his outstanding service to the Society as editor of Herpetological Review for the past two years.

WHEREAS, Dr. Robert E. Gordon and his constitution committee consisting of Drs. Carl Gans, J. P. Kennedy, C. J. McCoy, and David Wake have worked hard and long in structuring a sound constitution and by-laws for the Society for the Study of Amphibians and Reptiles, be it therefore

RESOLVED, that these individuals receive our heartfelt thanks for performing their arduous and important task in a most professional manner.

WHEREAS, the nominating committee chaired by Dr. James C. List and consisting of Mr. David M. Dennis, Dr. James Fowler, Dr. James A. MacMahon, and Dr. Joseph Tihen has presented a distinguished list of nominees for the various offices of the Society for the Study of Amphibians and Reptiles, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles hereby express its deep appreciation to the committee for their services.

WHEREAS, Dr. James Vial conducted one of the most successful membership campaigns during 1969 that the Society for the Study of Amphibians and Reptiles has ever experienced, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles express to Dr. Vial its congratulations and deepest appreciation for the excellent job he has done.

WHEREAS, the 12th annual meeting of the Society for the Study of Amphibians and Reptiles must be considered as one of the most successful and enjoyable of all meetings of the Society, in spite of rain guaranteed not to fall, and

WHEREAS, the success of the meeting was in large part due to careful planning and superb efficiency by the local committee, be it therefore

RESOLVED, that the Society for the Study of Amphibians and Reptiles express its sincere appreciation to the local committee consisting of Dr. Ronald A. Brandon (Chairman) and his assistants Dr. Ronald G. Altig, Dr. Joseph A. Beatty, Mr. and Mrs. Joseph Besharse, Mr. and Mrs. Ralph Brandon, Miss Pat Collins, Dr. William George, Mr. William Griffith, Mr. and Mrs. Thomas Harris, Dr. James E. Huheey, Dr. Willard D. Klimstra, Dr. John N. Krull, Dr. Eugene A. LeFebvre, Mr. Ray Schaaf, and Dr. Philip W. Smith.

Finally, we would like to thank Dr. Edward H. Taylor for showing the younger members of this very young Society how its done. His skillful blending of humor, enthusiasm, and scholarship will long be remembered as a high point of the 12th Annual Meeting of the SSAR.

Saturday evening a chicken barbeque supper and social were held at SIU's outdoor laboratory at Little Grassy Lake. Several herpetological slide travelogues were shown, including one of the Far East by Robert Gordon. Ronald Altig organized a fine photographic and slide show during the meeting, which included materials from Jeffrey Black, Edmund D. Brodie, Jr., Joseph T. Collins, Glenn Gentry, Harry Greene, John Hess, J. P. Kennedy, Jeffrey Lang, James C. List, Craig E. Nelson, Raymond Schaaf, Philip W. Smith, Edward H. Taylor, and James Wernz.

The success of the meeting was due to the careful planning and imagination of Ronald Brandon and the members of his committee listed in the above resolution. The attractive campus, the excellent facilities and the well-executed program will be remembered. It was encouraging to see such a large number of graduate students in attendance and their papers this year were exceptionally good.

WALTER RAY MOBERLY, 1941-1969

Walter Moberly, assistant professor of biology at the University of Oregon, was killed in an automobile collision on July 22, 1969. Walt received his bachelor's degree (with high honors) at the University of California, Riverside, where he worked with Wilbur Mayhew. As a senior, Walt's promise was already apparent with his work on hibernation in the desert iguana, Dipsosaurus. Leaving his native California which he held in great affection, Walt went east for graduate study at The University of Michigan with William Dawson. He was a respected member of the graduate student body and those of us who were there during that period will remember his frank humor, the generosity with his own time, and particularly his broad interest in biology. Walt's thesis research on metabolism and thermoregulation in the common iguana, Iguana, demonstrated his keen interest in reptiles and his knack for attacking a fundamental biological problem, the origin of homeothermy. He had an inventive and sharp mind and he developed some particularly elegant experiments to investigate the metabolic capacity for work in the iguana. One technique involved teaching four-foot-long iguanas to walk on a treadmill at variable speeds while metabolic rate was measured with a mask fitted to the head; an electric shock to the tail provided the motivation for learning! It was not enough for him to measure heart rates or oxygen debts in the lab; Walt wanted to know whether his measurements meant anything to the lizards. Thus, his work on iguanas naturally took him to the tropics where he enjoyed catching his own animals. He would send an assistant up a tree to force the lizards to jump; Walt would wait below to catch the animals during those few vulnerable seconds after they hit the ground. Most of this work was done along the Río Raposo in Colombia (photo; Walt is second from left).

After receiving his Ph. D. in 1966, Walt returned to the west coast by taking the position at Oregon. During the summer of 1969 he taught a course in comparative physiology at the University's Institute of Marine Biology at Charleston; it was on one of his commuting trips to teach there that he was killed. Walt was a rare individual who possessed great intellectual ability in combination with a very likable manner. He will be affectionately remembered by those who knew him. This will include the person who lost a five-dollar bet to Walt after a costume party at which Walt was dressed in a colonial white wig and baggy black pants. For the five dollars, Walt had to wear his costume to school for a whole day, which he did to everyone's amusement. Walt's tragic death at this early stage in a productive career is a profound sorrow.

A memorial fund has been established in Walt's name at Oregon to provide scholarships at the marine institute he served so well. Contributions may be addressed to the University of Oregon Development Fund, Eugene, Oregon 97403, to the account of the "Walter Moberly Memorial."

----- WILLIAM A. DUNSON and KRAIG ADLER.

SOCIETY OFFICERS ELECTED FOR 1970

Ballots for offices for the SSAR have been tabulated and a report submitted by Dr. William E. Duellman (Election Chairman). The following persons have been elected to serve for calendar 1970:

CHAIRMAN
Ronald A. Brandon
Southern Illinois University
Carbondale

CHAIRMAN-ELECT
Robert E. Gordon
University of Notre Dame
Indiana

SECRETARY
Joseph T. Collins
Museum of Natural History
University of Kansas

TREASURER
Henri C. Seibert
Ohio University
Athens

DIRECTORS
James R. Dixon
Texas A & M University

Richard Etheridge
San Diego State College

Sherman A. Minton, Jr.
Indiana University Medical Center

George R. Zug
Smithsonian Institution

MEMBER'S DESIDERATA

Cornell University needs specimens of amphibians and reptiles for a herpetology teaching collection. Families and genera from South America, Europe, Africa, Asia, and Australia are particularly needed. Specimens from the Ithaca, New York area are available for exchange. Persons or institutions interested should contact: Dr. F. Harvey Pough, Section of Ecology and Systematics, Langmuir Laboratory, Cornell University, Ithaca, New York 14850.

IMPORTANT NOTICE

As per the recent decision of the SSAR Board of Directors, dues for Life Membership in the Society for the Study of Amphibians and Reptiles will be increased from $100.00 to $150.00 effective 1 January 1971. All persons planning to join at this category are urged to do so before the above date in order to take advantage of the lower rate. Life membership dues will be received and handled during 1970 by: Joseph T. Collins, Secretary-SSAR, Museum of Natural History, University of Kansas, Lawrence, Kansas 66044.

NEW BOOKS & REPRINTS

Sierra Nevada Amphibians by Harold Basey. 1969. 27 pages, 16 color plates. Available postpaid for $1.45 from: Sequoia Natural History Association, Three Rivers, California 93271.

Anatome Testudinis Europaeae by L. H. Bojanus. 1819-1821. 250 pages, 41 plates. An SSAR reprint will include an introduction by Alfred S. Romer. Prepublication prices to SSAR members: $13.00 paperbound, $15.00 cloth; price to institutions and non-members: $18.00 and $20.00 respectively. Available from: Dr. Henri Seibert, SSAR, Department of Zoology, Ohio University, Athens, Ohio 45701.

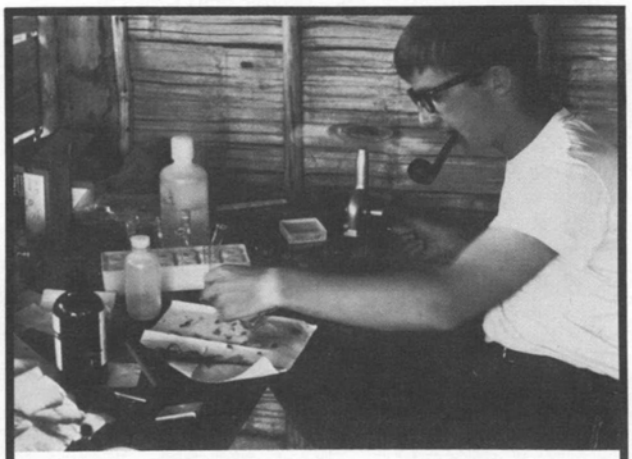
Venomous Animals and Their Venoms edited by Wolfgang Bucherl, Eleanor E. Buckley, and Venancio Deulofeu. Volume 1, Venomous Vertebrates, 1967. 707 p. Available for $34.00 from: Academic Press, 111 Fifth Avenue, New York, New York 10003.

A Review of the Water Snakes of the Genus Natrix in Mexico by Roger Conant. 1969. Bull. American Mus. Nat. Hist. 142 (1): 1-140, 22 plates, 6 maps. Available for $8.00 from: American Museum of Natural History, Central Park West at 79th Street, New York 10024.

The Origin of Terrestrial Vertebrates by I. I. Schmalhausen. Translated from Russian by Leon Kelso with preface by Carl Gans. 1968. 314 p. Available for $15.00 from: Academic Press (see address above).

Skulls of Gymnophiona and their Significance in the Taxonomy of the Group by Edward H. Taylor. 1969. Univ. Kansas Sci. Bull. 48 (15): 585-687. Available for ca. $1.60 from: Univ. Kansas Libraries, Lawrence, Kansas 66044.

□□□□□□



The University of Kansas has had a long history of research in systematics and ecology of amphibians and reptiles. The facilities and staff of the Museum of Natural History and the Natural History Reservation are now combined with part of the former Department of Zoology into the new academic Department of Systematics and Ecology of the Division of Biological Sciences. This department has 24 faculty members. Currently 57 graduate students are enrolled in the department; nine of these are working on problems dealing with amphibians and reptiles.

The Division of Herpetology of the Museum of Natural History under the curatorship of Dr. William E. Duellman contains a collection of 125,500 specimens, including a large number of skeletal preparations. An outstanding herpetological library and extensive collection of tape recordings are housed in the museum. A sound analysis laboratory, histology laboratory, constant temperature units, and cytology laboratory complete the physical facilities of the Division. Research by the staff and students in the Division is highly varied and ranges from studies on the cranial anatomy of frogs under the direction of Research Associate, Dr. Linda Trueb, to numerical taxonomy of collared lizards, genus Crotaphytus, by graduate student Richard R. Montanucci.

An important aspect of the research carried out by members of the Division concerns the systematics and ecology of tropical herpetofaunas; interests and field work range from México to Perú and Brasil. Every graduate student and all staff members have worked in Latin America for varied lengths of time. Three years ago a field study of an Amazonian herpetofauna was initiated at Santa Cecilia, Ecuador. The resulting field station, Muñozlandia, has been visited by three staff members and six graduate students, who have spent an accumulated 20 man-months in the field there.

Field party - Munozlandia, Ecuador; left to right: Linda Trueb, Charles Walker (University of Michigan), Ildefonso Munoz B. (owner of Munozlandia), William E. Duellman, and Thomas H. Fritts.

Chromosome preparations are made from centrifuged bone marrow by Thomas H. Fritts at laboratory at Munozlandia in Ecuador.

Research and travel funds provided by the University of Kansas enable students to carry out extensive field work or travel to other museums for study of material. Accordingly, three graduate students have either just completed, or are carrying out, field work in the tropics: Martha L. Crump just returned from seven months of study on the ecology of amphibians at the Area de Pesquisas Ecológicas do Guamá near Belém, Brasil; Janalee P. Caldwell has started a one year field study of resource partitioning in frogs in Oaxaca, México; Thomas H. Fritts is now in Perú for a year studying speciation in the Andean iguanid lizards of the genus Ophryoessoides.

Additional research on Neotropical amphibians and reptiles includes the systematics of frogs, genus Colostethus, by graduate student Stephen R. Edwards; the evolutionary relationships of some South American montane toads by Dr. Linda Trueb, and reproductive cycles in certain Costa Rica lizards by Dr. Henry Fitch. Dr. William E. Duellman has an extensive research program on South American hylid frogs and is working with Charles W. Myers on the amphibians and reptiles of Panamá.

The Natural History Reservation, under the custodianship of Dr. Henry S. Fitch, is a 590 acre tract of land 7 miles northeast of the main campus. Although the Reservation is utilized for a wide variety of studies on the biota of northeastern Kansas, it is particularly well known for the number of studies by Fitch and graduate students on the life history and population ecology of amphibians and reptiles. Currently Fitch is completing a long-term study of the ring-necked snake, Diadophis punctatus arnyi; graduate student Arnold K. Smith is working on a population study of the bullfrog, Rana catesbeiana. Supplementing classical techniques of study is the new radio-telemetry equipment installed on the Reservation.

Professor Emeritus, Edward H. Taylor maintains an active research program on caecilians in the Museum of Natural History, and Dr. Theodore H. Eaton, Curator of Lower Vertebrate Paleontology is involved in various studies of Paleozoic amphibians and reptiles.

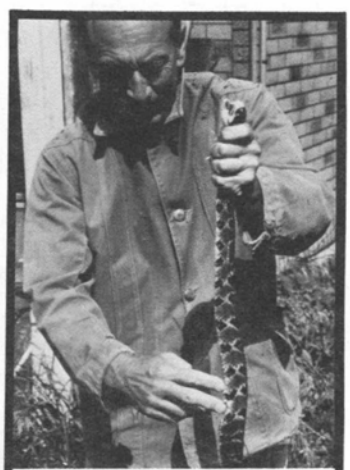
The University of Kansas has a large well-equipped Computation Center that provides a variety of data processing systems. Results of research by staff and students are published in numerous journals and in two University series--University of Kansas Publications, Museum of Natural History, and University of Kansas Science Bulletin.

Linda Trueb and Martha L. Crump prepare serial sections of frog skulls on a sliding hand microtome.

Photomicrographs of collared lizard chromosomes are taken by Richard R. Montanucci as part of his cytotaxonomic studies.

Edward H. Taylor makes active use of the herpetological libraries containing more than 2000 bound volumes and 10,000 reprints.

Joseph T. Collins examines specimens in the collection.



Audiospectrographic analysis of mating calls is a part of Stephen R. Edwards doctoral research on Colostethus.

Stephen R. Edwards consults with William E. Duellman about his research problems.

William E. Duellman and Joseph T. Collins discuss a curatorial problem of snake skeletons.

Henry S. Fitch notes position of recently swallowed radio transmitter in a timber rattlesnake on the Natural History Reservation.

CURRENT HERPETOLOGICAL TITLES, VIII: 1968-69

HERPETOLOGICAL INFORMATION SEARCH SYSTEMS

American Museum of Natural History
New York, N.Y. 10024

* * * * *

This is the seventh list that contains titles of books and articles relating to the field of herpetology that were published in 1968 and 1969. The 114 titles listed here brings the total for 1968 to 3,738, almost 50 per cent more than we estimated in 1967, and some 20 per cent more than we estimated last year (see Figure). And 1968 titles are continuing to come in! It may be that the final total for that year will approach 4,000.

Though we will continue to enter titles published during 1968 on the computer-tape memory, on the basis that two-year-old literature is no longer current, we will not publish these titles in forthcoming lists.

We realize that many of the titles listed are marginal to the field of herpetology as customarily defined. Many are published in journals of physiology, pharmacology, cytology, or embryology. Others are from medical journals, state fish and game publications, or pet animal journals. Thus, they are not aimed at an audience of herpetologists. All of them, however, deal in some way with amphibians and reptiles. As such, they may be of some interest to at least some readers of HERPETOLOGICAL REVIEW. It seems better to let the reader make the selection from the list, rather than one of our small group deciding that this paper or that -- or this kind of paper -- is of no interest to anyone.

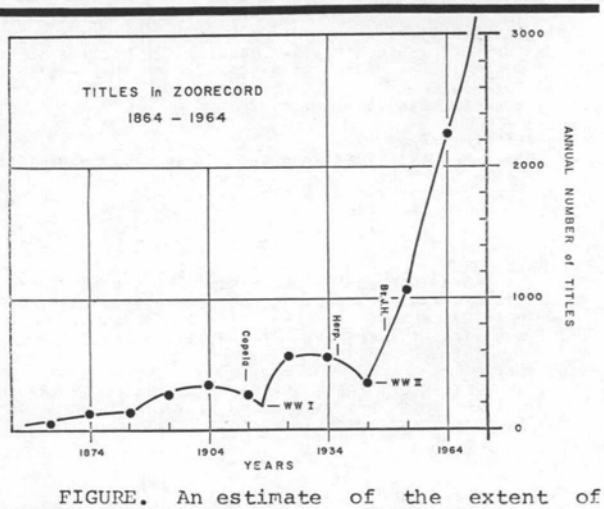


FIGURE. An estimate of the extent of herpetological literature based on counts of titles listed in the Amphibia and Reptilia sections of Zoological Record. Prepared in 1966, the figure has proven to show the trend, but not the extent of recent herpetological literature.

Our present policy, then, is to list the title of any paper that is concerned with a member of a Recent order of amphibians or reptiles.

Except for the omission of extinct orders, our list is comparable with that of the Amphibia and Reptilia sections of the Zoological Record, though ours is more comprehensive. We have published 7,619 "Current Titles" since January 1968.

This eighth list contains titles of books and articles that have come to our attention during the period 26 July through 17 October 1969. It is divided into two separate, alphabetically-arranged sections: one for titles published in 1968, and one for titles published in 1969.

Acknowledgements. This list was prepared by the HISS staff: H. G. Dowling, I. Gilboa, I. Palser, and T. Shaman. J. A. Peters of the U. S. National Museum has continued to provide a welcome back-up program to our search of the literature, and G. J. Jacobs of NASA has kept us informed of the many publications and translations resulting from the United States space efforts. We also wish to thank the many individuals who have sent us early copies of reprints for inclusion here.

Members of the Herpetology Department and the Library staff of the Museum have continued to aid our efforts. No commercial computer service yet offers all of the facilities that we need, however, and we continue to rely on the advice and aid of James E. Bradley of the University of Rhode Island Computer Laboratory. We are grateful to all of these individuals and institutions for their help.

This is contribution Number 15 of the Genera of Reptiles Project, which is supported by the Information Services Program of the National Science Foundation (NSF GN-707).

DEADLINE FOR HERPETOLOGICAL REVIEW

Material for Herpetological Review #9 (December 1969) can be accepted no later than 5 October 1969.

It is preferred that feature articles be submitted prior to the above deadline dates if possible.

Results of an explosive burst of reproduction following spring emergence from hibernation in the Australian burrowing leptodactylid Limnodynastes dorsalis (Gray). The frothy egg masses are each 12 - 18 cm in diameter and contain 3,000 - 4,000 eggs. Locality is a permanent pond 3 miles SW. of Petersons (about 35 miles NNE. of Melbourne), Victoria, Australia; 16 October 1966. Exposure Data: Praktica IV camera; Kodak Plus-X film; 1/50 sec. at f8. Photograph by A. A. Martin, Department of Zoology, University of Melbourne, Parkville, Victoria 3052, Australia.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles.

SOCIETY DUES FOR 1969

Dues for calendar 1969 are: Regular member (U. S. and Canada) - $6.00; Foreign member - $5.00 (via international money order); Sustaining member - $8.00; Contributing member - $15.00; and Life member - $100.00. Institutional subscription is $10.00.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

SSAR acknowledges support

In this issue of Herpetological Review the Society gratefully acknowledges the following persons who have subscribed as of July 1969 to the higher SSAR membership categories. This support allows expansion that would be impossible through regular income.

SSAR LIFE MEMBERS

Joseph T. Collins
Roger Conant
William G. Degenhardt
M. J. Fouquette, Jr.
Howard K. Gloyd
Harold Heatwole
James E. Huheey

new books & reprints

Anatome Testudinis Europaeae by L. H. Bojanus. A facsimile reprint of this classic in turtle anatomy will be issued by the SSAR in winter 1969-70. Originally issued in an edition of 80 copies at Wilna, Lithuania, in 1819-1821; 250 pages, 41 plates (folio). The reprint will include an introduction by Alfred S. Romer. Prepublication prices to SSAR members, $13.00 paperbound, $15.00 cloth; price to institutions and non-members, $18.00 and $20.00 respectively. Please use the enclosed order blank; orders should be addressed to Henri C. Seibert, Department of Zoology, Ohio University, Athens, Ohio 45701.

Bibliography of the Chameleontidae (1864-1964) by Stephen D. Busack. 1969. 12 pages. Available from: Smithsonian Herpetological Information Service (SHIS), Division of Reptiles & Amphibians, U. S. National Museum, Washington, D. C. 20560.

Bibliography of the Herpetological Papers of Frank Wall (1868-1950) by Simon M. Campden-Main. 1969. 7 pages. Available from SHIS (see address above).

Physiological Systems in Semiarid Environments. Edited by C. Clayton Hoff and Marvin L. Riedesel. 1969. Available for $9.00 from: University of New Mexico Press, Albuquerque, New Mexico.

Venomous Reptiles by Sherman A. Minton, Jr. & Madge R. Minton. 1969. Available from Scribners & Sons for $7.95.

Les Salamandres d'Europe d'Asie et d'Afrique du Nord. (Encyclopédie Pratique du Naturliste XXXV) by Robert Thorn. 1969. 376 pages, 56 text figures, 11 maps and 16 plates. Available for $19.00 from: Editions Paul Lechevalier, 18, Rue des Ecoles, Paris - V^{e}, France.

Taxonomic Index to Andersson and Lonnberg Papers on Present Location of Linnaean Reptile and Amphibian Types by Paulo E. Vanzolini. 1969. 10 pages. Available from SHIS (see address above).

Herpetologica Mexicana by A. F. A. Weigmann. A facsimile reprint of this book has just been issued by the SSAR. The introduction by Edward H. Taylor gives details of Weigmann's types, type localities and field collectors. Eighty pages, folio; $3.00 to SSAR members from Dr. Seibert (see address above). Prices will be doubled shortly.

book review

EARLY FOUNDATIONS OF MEXICAN HERPETOLOGY. By Hobart M. Smith and Rozella B. Smith. University of Illinois Press. 1969. $6.50.

The father of Mexican herpetology, Alfredo Augusto Delsescautz Dugès, was born in Montpellier, France on April 16, 1826. He came to Mexico in 1853 and died on January 10, 1910. During his productive life as a gynecologist, professor of natural history and director of the natural history museum that he founded in the state college of Guanajuato he authored 184 publications, 94 of which pertain to herpetology. Most of his scientific studies were made during frustrating and unfavorable circumstances; but his industry, perseverance and judgement clearly establish his pertinent herpetological studies as central to an understanding of the early foundations of Mexican herpetology.

This attractive little book by Hobart and Rozella Smith is an annotated bibliography and index to the herpetological publications of Dugès. The authors have extensively utilized automation techniques in collating and assembling the bibliography. They have located rare and previously inaccessible publications. Two are reproduced in facsimile; they are "Fauna Del Estado De Guanajuato" and "Glándulas Salivares De Los Ofidianos." For each bibliographic entry there is a complete citation that is sure to be useful to students of Mexican amphibians and reptiles, but this book is more than a simple bibliography. It has considerable taxonomic importance.

All herpetological taxa created by Dugès are listed in an appendix with corresponding modern synonyms. Of 40 taxa erected by Dugès, 23 are considered as invalid. There is also an index to genus and species group names as they appeared in Dugès' publications with modern equivalents for relatively obscure applications.

This book should be of interest to anyone who has assumed the risk of improving one's knowledge of the amphibians and reptiles of Mexico.

J. P. KENNEDY, University of Texas Dental Branch, Texas Medical Center, Houston, Texas 77025.

HERPETOLOGIST'S LEAGUE MEETS

The Herpetologist's League will again hold its annual meeting in conjunction with the AAAS meetings, 26-31 December 1969, in Boston, Massachusetts. A detailed outline and preliminary program of the meeting will appear in the September issue of Science. Details of paper sessions will be available only in the General Program prepared and sold by AAAS.

Herpetologist's League sessions will be held on 28-29 December only, with the possibility of some informal activity on 30 December. Lists of papers to be presented will be available only in the General Program sold by AAAS. Room assignments are tentatively set up for the Statler Hilton Hotel.

MEMBERS DESIDERATA

For sale - Books, Journals, & Reprints on herpetology. Includes Ditmars, Cornell Series, Herpetologica Volumes 1 & 6 to 13. Also some Copeia. Write to: Ralph Sinclair, 1197 Holz Avenue, Cincinnati, Ohio 45230.

news from institutions

NOTRE DAME HERPETOLOGY PROGRAM

At Notre Dame research in amphibian and reptile biology is particularly active; the approach is diverse yet integrated. Modern research facilities are available, including several programmable environmental chambers, recording and data processing equipment, apparatus for rearing and maintaining living animals, and extensive reprint collections. Much of the field work with these organisms is done in the Appalachians, and research is now being initiated on several of the species that are abundant at the University's Environmental Research Center in northern Wisconsin.

Current work includes studies on regeneration, oogenesis, development of tumors and the experimental transmission of cancer in frogs. Research on amphibian evolution and phylogeny, as based on comparative morphology and the fossil record, is currently centered on Miocene faunas of North America and the evolution of toads (Bufo). Similar studies on turtles have involved both paleontological and archeological materials. Several of the staff and students are involved in behavioral and ecological studies. These include a comparative demographic study of temperate and tropical plethodontid salamanders, behavioral aspects of inter- and intraspecific competition, locomotor behavior and photoperiodic responses of salamanders and lizards and studies on orientation and migration in amphibians and reptiles. An extra-optic photoreceptive site has been located in the brain of salamanders of the genus Plethodon which can mediate light-cued phase shifts of the circadian locomotor rhythm. Studies are now underway to determine the types of light cues used and the importance of these cues to other behavioral and physiological events.

Staff members having research interests in herpetology at Notre Dame are Drs. K. Adler, R. E. Gordon, J. A. Tihen and K. S. Tweedell.

OOOOO

CURRENT HERPETOLOGICAL TITLES, VII: 1968-69

by HERPETOLOGICAL INFORMATION SEARCH SYSTEMS

American Museum of Natural History
New York, N.Y. 10024

* * * *

To date the current list of titles has been no more than that. However, our files now contain some 18,000 titles of which more than 6,000 are current and have been published in Herpetol. Rev. (2-7). The cross index file to these titles is growing rapidly.

The name of the project has been changed to more clearly indicate its present emphasis. We anticipate computer access to the HISS data bank via taxonomic, geographic and subject routes next year.

This seventh list compiled by our staff (Dowling, Gilboa, Palser and Shaman) includes titles that have come to our attention during the period 26 April through 25 July 1969. It is published as a direct photo-offset reproduction from printout obtained from our IBM 2741 terminal. Some of the titles were punched on cards prior to the arrival of the terminal with upper and lower case capability and appear in this list in upper case.

The list is divided into two parts: titles published during 1968, and titles published during 1969. All these and future 1969 titles are available also on 3 x 5 library stock cards on a yearly subscription basis at 250 dollars a year per set or 600 dollars per 3 sets (for Author, Subject and Geography files). Abstracts are added to the titles when possible.

Acknowledgements: This list was prepared with the aid of the Herpetology Department and the Library of the Museum, and the Department of Zoology and the Computer Laboratory of the University of Rhode Island. We are especially grateful for the help of James E. Bradley and Harlan S. Mersey of the Computer Laboratory. Several colleagues have aided by bringing additional literature to our attention. Formost among these are James A. Peters, and George J. Jacobs. Richard G. Zweifel and Margaret S. Shaw, of the Department of Herpetology, have aided the project in many special ways. Robert J. Winter of the Department of Ichthyology has been very helpful with translations from Slavic journals. We are grateful for all of this help. This is contribution No. 14 of the Genera of Reptiles Project, which is supported by the National Science Foundation (NSF GN-707).

ALPHABETIC LIST OF JUNIOR AUTHORS

ON THE CODES: THE "SEE" CODES REFER BACK TO THE LISTS OF FULL CITATIONS THAT ARE ARRANGED ALPHABETICALLY BY THE NAME OF THE SENIOR AUTHOR WITHIN THE LIST FOR 1968. THE CODE IS DERIVED FROM THE FIRST FOUR LETTERS OF THE SENIOR AUTHOR'S FAMILY NAME AND THE INITIAL LETTERS OF HIS (FIRST TWO) GIVEN NAMES. THE NUMERALS ARE THE YEAR OF PUBLICATION (MINUS THE INITIAL "1") AND THE THREE LETTERS WHICH FOLLOW ARE THE INITIAL LETTERS OF THE FIRST THREE SIGNIFICANT WORDS IN THE TITLE. THE NUMERALS AFTER THE COLON REFER TO THE INITIAL PAGE NUMBER OF THE ARTICLE. THIS CODE, DERIVED ENTIRELY FROM THE ARTICLE AT HAND, DOES NOT FOLLOW STRICT ALPHABETICAL ORDER, BUT IT IS EXPLICIT. THE LIST BELOW WAS ARRANGED BY CODE: THUS IT IS NOT STRICTLY ALPHABETIC. ***

DEADLINE FOR HERPETOLOGICAL REVIEW

Material for Herpetological Review #8 (September 1969) can be accepted no later than 10 July 1969.

Material for Herpetological Review #9 (December 1969) can be accepted no later than 5 October 1969.

It is preferred that feature articles be submitted prior to the above deadline dates if possible.

CURRENT HERPETOLOGICAL TITLES, VI: 1968-69

BY H.G.DOWLING, I.GILBOA, I.PALSER AND T.SHAMAN

GENERA OF REPTILES
AMERICAN MUSEUM OF NATURAL HISTORY
NEW YORK, N. Y. 10024

* * * *

THIS IS THE SIXTH LIST OF CURRENT HERPETOLOGICAL TITLES (SEE HERPETOL. REV. (2-6) FOR PREVIOUS ISSUES.) IT INCLUDES TITLES THAT HAVE COME TO OUR ATTENTION DURING THE PERIOD 2 FEBRUARY THROUGH 25 APRIL 1969. THE RECENT DOCK STRIKE HAS DELAYED RECEIPT OF A NUMBER OF FOREIGN JOURNALS DURING THIS PERIOD. AS BEFORE, A FEW TITLES HAVE BEEN OBTAINED FROM SECONDARY SOURCES, BUT THESE MAKE UP LESS THAN FIVE PER CENT OF THE TITLES LISTED. LIKE THE PREVIOUS LISTS, THIS ONE IS PHOTO-OFFSET REPRODUCTION FROM COMPUTER PRINTOUT.

THE VAST MAJORITY OF LISTED PAPERS IS IMMEDIATELY AVAILABLE TO US. WE ARE BASED AT ONE OF THE GREATEST (AND LIKELY THE MOST ACCESSIBLE) HERPETOLOGICAL LIBRARIES OF THE WORLD. WE ANTICIPATE BEING READY TO ACT AS A BIBLIOGRAPHIC SERVICE IN 1970. HOWEVER, IF YOU ARE REALLY STUCK FOR A REFERENCE NOW, LET US KNOW: WE WILL SEE WHAT WE CAN DO.

THE LIST IS DIVIDED INTO TWO PARTS: TITLES PUBLISHED DURING 1968, AND TITLES PUBLISHED DURING 1969. ALL THESE AND FUTURE 1969 TITLES ARE AVAILABLE ALSO ON 3 X 5 LIBRARY STOCK CARDS ON A YEARLY SUBSCRIPTION BASIS AT 25D DOLLARS A YEAR PER SET.

FUTURE: TO THIS DATE THE CURRENT LIST OF TITLES HAS BEEN NO MORE THAN THAT. HOWEVER, WE HAVE BEGUN TO CROSS-INDEX THE LITERATURE FOR ACCESS THROUGH TAXONOMIC, GEOGRAPHIC, AND SUBJECT AVENUES. WE DO NOT ANTICIPATE PUBLISHING THIS INDEX BUT INSTEAD ARE ATTEMPTING TO COORDINATE OUR EFFORTS WITH BIOLOGICAL ABSTRACTS AND ZOOLOGICAL RECORD. BOTH OF THESE INSTITUTIONS HAVE INDICATED AN INTEREST IN COORDINATING THE INFORMATION OBTAINED HERE WITH THAT DERIVED FROM THEIR OWN SOURCES, BUT WE ARE EXPLORING VARIOUS OTHER POSSIBILITIES.

ACKNOWLEDGMENTS: THIS LIST WAS PREPARED WITH THE AID OF THE HERPETOLOGY DEPARTMENT AND THE LIBRARY OF THE MUSEUM, AND THE DEPARTMENT OF ZOOLOGY AND THE COMPUTER LABORATORY OF THE UNIVERSITY OF RHODE ISLAND. WE ARE ESPECIALLY GRATEFUL FOR THE HELP OF JAMES E. BRADLEY AND HARLAN S. HERSEY OF THE COMPUTER LABORATORY. SEVERAL COLLEAGUES HAVE AIDED BY BRINGING ADDITIONAL LITERATURE TO OUR ATTENTION. FORMOST AMONG THESE ARE JAMES A. PETERS, AND GEORGE J.JACOBS. RICHARD G.ZWEIFEL AND MARGARET S.SHAW, OF THE DEPARTMENT OF HERPETOLOGY, HAVE AIDED THE PROJECT IN MANY SPECIAL WAYS. ROBERT J. WINTER OF THE DEPARTMENT OF ICHTHYOLOGY HAS BEEN VERY HELPFUL WITH TRANSLATIONS FROM SLAVIC JOURNALS. WE ARE GRATEFUL FOR ALL OF THIS HELP. THIS IS CONTRIBUTION NO. 12 OF THE GENERA OF REPTILES PROJECT, WHICH IS SUPPORTED BY THE NATIONAL SCIENCE FOUNDATION (NSF GN-707).

*****

1968 TITLES

--- A ---

ABRAHAM,A.
1968 ELECTRON-MICROSCOPIC EXAMINATIONS ON THE STRIATED MUSCLE CELLS OF THE HEART-WALL OF THE POND TORTOISE (EMYS ORBICULARIS)
ACTA BIOL ACAD SCI HUNG 19(4):493. (ABSTR)

ALPHABETIC LIST OF JUNIOR AUTHORS

ON THE CODES: THE "SEE" CODES REFER BACK TO THE LISTS OF FULL CITATIONS THAT ARE ARRANGED ALPHABETICALLY BY THE NAME OF THE SENIOR AUTHOR WITHIN THE LIST FOR 1968. THE CODE IS DERIVED FROM THE FIRST FOUR LETTERS OF THE SENIOR AUTHOR'S FAMILY NAME AND THE INITIAL LETTERS OF HIS (FIRST TWO) GIVEN NAMES. THE NUMERALS ARE THE YEAR OF PUBLICATION (MINUS THE INITIAL "1") AND THE THREE LETTERS WHICH FOLLOW ARE THE INITIAL LETTERS OF THE FIRST THREE SIGNIFICANT WORDS IN THE TITLE. THE NUMERALS AFTER THE COLON REFER TO THE INITIAL PAGE NUMBER OF THE ARTICLE. THIS CODE, DERIVED ENTIRELY FROM THE ARTICLE AT HAND, DOES NOT FOLLOW STRICT ALPHABETICAL ORDER, BUT IT IS EXPLICIT. THE LIST BELOW WAS ARRANGED BY CODE: THUS IT IS NOT STRICTLY ALPHABETIC. ***

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles.

SEE PAGE 4 OF THIS ISSUE

FOR DUES INFORMATION

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

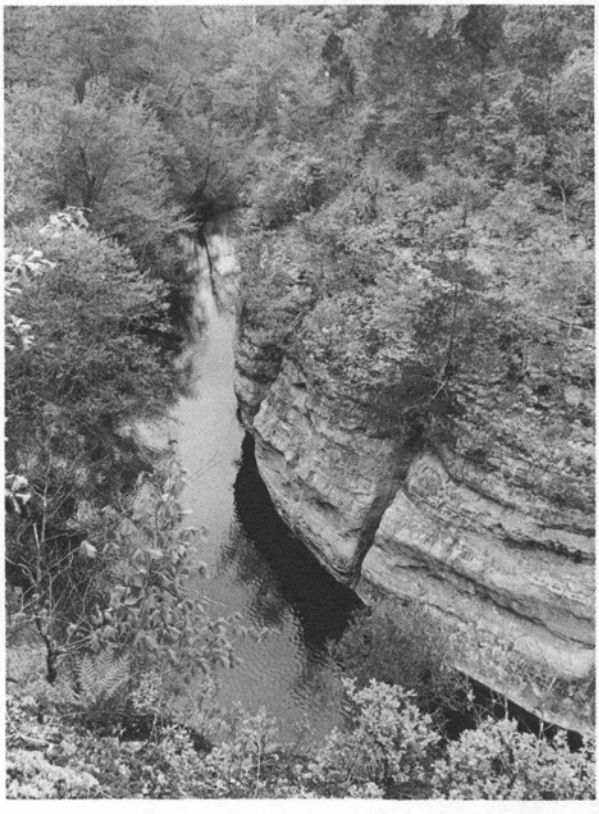
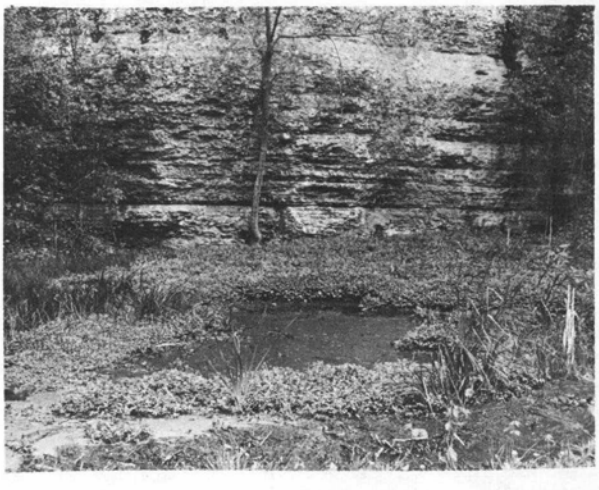
SSAR meeting at Carbondale

THIS SUMMER'S SSAR MEETING



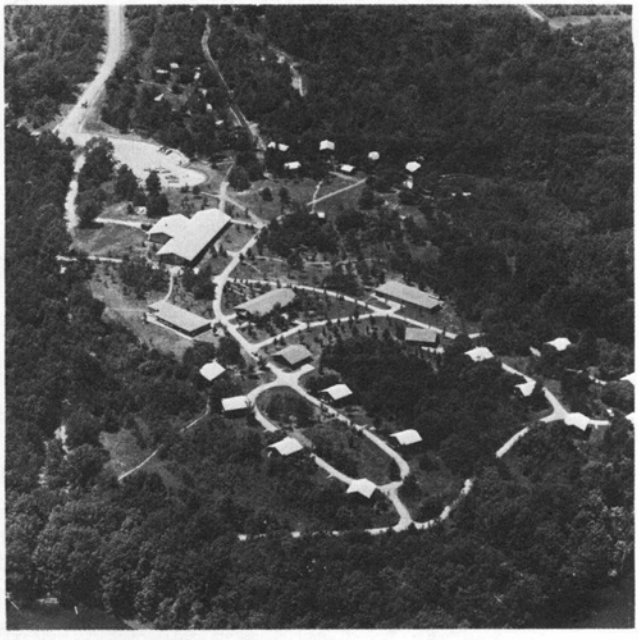
The twelfth annual meeting of the Society will be held 5-7 September 1969, on the Carbondale campus of Southern Illinois University. Carbondale, a small city of 20,000 residents, is located approximately 100 miles southeast of St. Louis and 170 miles northeast of Memphis, at the northern edge of the Shawnee Hills Section of Illinois, just 60 miles above the confluence of the Mississippi and Ohio rivers. The setting is rural, with forests, orchards, and small farms interspersed at a mean elevation of 450 feet. Only a few miles from Carbondale are Shawnee National Forest, Crab Orchard Lake and National Wildlife Refuge, and several state parks.

Paper sessions will be held in Lawson Hall, a new classroom building composed solely of auditoriums. Neely Hall will provide dormitory sleeping quarters; both buildings are air conditioned. Restaurants and additional lodging accomodations are available in Carbondale, and within 10-15 miles of town are some 500 campsites. During the lull between quarters the campus will be relatively free of SIU's 21,000 students.



Tentatively planned are the Board of Director's meeting Friday evening, paper sessions on Saturday and Sunday, a banquet and social evening Saturday at SIU's Little Grassy Outdoor Laboratory, and a Saturday bus excursion (for the ladies and children) through scenic hill and orchard country, Shawnee Forest, Bald Knob, Pine Hills, and the Mississippi River bottoms. A display of photographs is planned. Photos should be sent to Ronald G. Altig, Department of Zoology, Mississippi State University, State College, Mississippi 39762.

Details of the program, registration, local accomodations and transportation will be mailed to members in mid-May. Ronald A. Brandon, Department of Zoology, Southern Illinois University, Carbondale 62901, is serving as meeting chairman.



the meeting site

Persons attending the SSAR 11th annual meeting at SIU will see sights such as this scenic area near Carbondale, Illinois.

The SSAR annual meeting will feature such collecting areas as La Rue Spring in the Pine Hills area of Union County, Illinois. This is the habitat of Rana clamitans, Acris crepitans, Hyla cinerea, Siren intermedia, Plethodon dorsalis, Eurycea lucifuga, E. longicauda, Sternothaerus odoratus, Farancia abacura, Agkistrodon piscivorus, Natrix erythrogaster, and others.

An aerial view of SIU's Little Grassy Outdoor Laboratory. The SSAR Saturday banquet and social get-together will be held here.

The paper sessions of the SSAR annual meeting will be held in SIU's modern Lawson Hall.

***

SOCIETY DUES FOR 1969

Dues for calendar 1969 are: Regular member (U. S. and Canada) - $6. 00; Foreign member - $5. 00 (via international money order); Sustaining member - $8. 00; Contributing member - $15. 00; and Life member - $100. 00. Institutional subscription is $10. 00.

The Second Century of Alfredo Dugès, Father of Mexican Herpetology

By

Hobart M. Smith and Robert W. Reese

Alfredo Dugès, 1826-1910, has long been famous as the father of Mexican herpetology. He published 83 articles and books, in his lifetime, that concerned Mexican herpetology and his 1896 synopsis of the Mexican herpetofauna stood until 1950 as the only summary of that complex fauna. Even today his contributions require the attention of every monographer of any herpetozoon group occurring in Mexico. An important future role for his works published before his death has been underwritten by a recent digest in detail (Smith and Smith, 1969).

As indicated in the latter work (p. 4), ". . . incredible handicaps to scientific endeavor . . . beset Dugès in his life in Mexico . . .: the illnesses (including deafness), the vagaries of employment, the necessity for extreme frugality, the isolation from scientific centers, the deplorable library facilities, and the magnitude of frustration and depression these handicaps created. Dugès' accomplishments appear heroic indeed under the conditions he encountered. Under the more favorable conditions enjoyed by many of his contemporaries his productivity would no doubt have approached the best of his time; his actual circumstances would surely have completely defeated most scientists. Despite his relatively meager productivity, as compared with Cope, Boulenger, Bocourt, Duméril and other top-flight herpetologists of the period, Dugès merits the accolade of equality with even these scientific greats, judged upon the basis of proportion of output to circumstantial limitation."

Until recent years, the scholarly rank of Alfredo Dugès has of necessity been judged upon the basis of his works published before his death. Like many other great scholars, however, he continued writing in his final years and died with numerous works in various stages of completion. This discovery was made by Prof. Marcos Areliano Armenta, and his wife Irma Bustos de Areliano, as a result of their long-standing devotion to the heritage of the University of Guanajuato from Alfredo Dugès, in the form of the Museum bearing his name: the Museo Alfredo Dugès. When Mr. Arellano was a student in biology at the University of Guanajuato, his interest was centered irrevocably upon the Museum through the influence of Manuel Maldonado Koerdell, who studied and reported in detail the amphibian collection there (Maldonado-Koerdell, 1948). As he received his degree and continued with postgraduate study, he maintained his interest, reviewing in 1952 the scope and content of the Museum.

In these and subsequent years he became acquainted with Prof. Rodolfo R. Ramírez of Guanajuato, who had been an assistant to Dugès in his last years. In fact Prof. Ramírez was with Dugès at his death, and he later assumed responsibility of safe-keeping and publication of Dugès' manuscripts and illustrations that were in final, or nearly final, form. These he acquired from Miss Maria Híjar, a member of the family with whom Dugès lived after the death of his wife, and to whom the materials were bequeathed. Indeed the task of assuring their safety was of such great magnitude, as revolution swept the country, that publication became of secondary importance. In 1954 Prof. Ramirez died, leaving full instructions for the destiny of Dugès' scientific materials to his adopted son, Dr. Janaro González Reyna. The library was, unfortunately, sold to a bookstore in Mexico City.

As a student in early years, and later as Director of Biology and Curator of the Dugès Museum, Prof. Arellano persistently urged that the unpublished original material left by Dugès should be made available to science. In due time he was able to acquire all of the remaining original unpublished materials, with minor exceptions. Included are about 270 large watercolor plates, of which the majority are now in the possession of the Dugès Museum, beautifully illustrating various animal species of Mexico; correspondence with other scientists of the period (including letters from Asa Gray and E. D. Cope); several unpublished sets of handwritten notes in a notebook; and an extensive revision of his textbook of zoology. There are also about 500 5x7 inch black and white botanical drawings as well as a large number of small watercolors of various faunal groups. Of these smaller color plates many are evidently copies of illustrations contained in other publications. When this occurs, there is no signature, but a cryptic note such as "Wilson" will be found which possibly indicates the publication from which it was taken. All originals carry his distinctive signature.

The plates, both black and white and color, that remain in the possession of the Arellanos are in excellent condition. In their attention to detail they are typical of the handwork of many of the oldtime naturalists. Many of the illustrations are dated, and a decrease in quality can be detected as Dugès advanced in years.

In addition to these materials, the Arellanos discovered a remarkable collection of photographs of Dugès and his colleagues in the family possessions of the successors of the famous professional photographer and

international award winner Romualdo García, a student and subsequently a partner of the photographic firm of Ignacio Rocha and the chemist Vicente Fernández. All were personal friends of Dugès, and the glass plate collection includes many of Dugès, his colleagues, and events of his time. These form an important part of the incomparable and unique library of Dugèsiana now owned by Prof. and Mrs. Arellano.

A very small part of the correspondence, of the revised textbook, of the zoological plates and of the photographs have been published by Prof. and Mrs. Arellano (see accompanying bibliography). It is their intent eventually to publish all significant parts, donating the entire collection to that institution willing to underwrite their publication. At present writing Prof. Arellano is not connected with the University of Guanajuato, but can, however, be addressed at Apartado Postal 121, Guanajuato, Gto., Mexico.

Many details of Dugès' life remain to be clarified. The events which led to his establishment in Guanajuato, the extent to which he practiced medicine, the origin and sequence of academic appointments, the family history of his wife, the circumstances of his courtship and marriage, are all largely unknown. Perhaps some of these unknown facets of his life, as well as others, may receive some light from these documents, the analysis of which should be pursued without delay.

Situated as they are in the long-time home of Dugès, the Arellanos will no doubt uncover still other new sources of information on the life of Dugès. For example, they have kindly provided us with a copy of the death certificate of Dugès' wife, Luisa Frey de Dugès, filled May 4, 1886, in which it is confirmed that she died of pneumonia at the age of 69, on May 3, 1886, at 3:30 pm. and that she was the legitimate daughter of Carlos Frey and Maria Juana Beaurepaire, both then deceased.

Through the kindness of Prof. and Mrs. Arellano the junior author had the pleasure of examining most of their Dugèsiana, and would like to express his gratitude for the privilege. We are indebted to them also for their very kind provision of most of the information here reported and for reprints of some of their publications pertaining to Dugès, a complete list of which is appended through their courtesy. They likewise have furnished us with a remarkable formal photographic portrait of Dugès (Fig. 1), hitherto published only in the article on Dugès and malaria (Arellano, 1965b). In response to a specific inquiry, they in addition sought out and photographed for us (Fig. 2) the tombs of Alfredo Dugès and his immediate family, all surprisingly impressive.

Thus has begun a revival from varied sources of interest in the work of Dugès. With the publication posthumously of his manuscripts by Prof. Arellano, the productivity of this outstanding scholar enters its second century.

Figure 1. Alfredo Dugès, 1878. Photograph by Rocha and Fernandez.

Figure 2. The tomb of Alfredo Dugès in the graveyard of Guanajuato, Gto., Mexico, viewed by Prof. Marcos Arellano. The apex of the columnar gravestone extends only very slightly out of the picture; the column appears broken, but was so designed perhaps to represent mortal life.

book review

Snakes: The keeper and the kept. By Carl Kauffeld. Doubleday & Co., Inc., Garden City, New York. xiv, 248 pp., 39 figs. $5.95.

This is two books rolled into one - (1) an essay on care of snakes, accompanied by five appendices giving basic information of interest to anyone beginning to develop serious interest in snakes; and (2) an account of the emotions, reflections, observations and events related to several of the author's collecting trips to various parts of the United States.

The obligations of a writer to the constructive instruction of his reader were taken seriously by Kauffeld, who lost no opprotunity to advance reader-awareness of the need for conservation, not only of snakes but of the entire communities of which they are a part, and for conscientious care of captured animals. At the same time he successfully portrayed the thrills and satisfaction of both the search for and the care of snakes.

Particularly in the first section of 92 pages of the book, largely about care of snakes in captivity, is narration and advice successfully blended. In fact this is the best source known to me for information on snake care, since it provides, with examples drawn from the author's wide experience, precise details on "how" as well as "what," expands on the advantages and disadvantages of different techniques, and thus provides for a real understanding by the reader of the varied factors involved in snake care, enabling him to exercise to a degree the judgement of an experienced keeper. Kauffeld's account provides the touch of reality that most books on snake care most seriously lack.

The appendices are widely separated from the introductory pages on snake care, but an adjunct in subject matter. The first appendix of six pages, lists 35 groups of North American snakes and gives their food, desirability for maintenance in captivity, and peculiarities, if any, that require special attention. The second appendix, of six pages, is an essay on scientific names - their origin, construction, basis of application and utility. The third appendix, of one page, calls attention to the need and basis for standardization of common names. The fourth appendix, of one page, lists 12 major popular reference works about snakes. The fifth appendix, of two pages, cites and gives addresses of scientific herpetological societies of the country and gives a few words of sage advice about the establishment, conduct and prognosis for success of amateur societies. All these appendices give much advice not commonly available for the budding herpetologist.

The second section of the book (139 pp.) is occupied with narratives of various field trips, and is useful not only as a means of introduction of readers to the very tangible thrill of the quest for snakes, but as propaganda for exercise of maturity in the hunt. Too often a field trip in search of snakes is an almost mad, often destructive, singleminded pursuit that leaves the habitat plundered and the collector oblivious to the majesty of the ecological community he has invaded. With frequent reference to the fascinating diversity of the several haunts described of snakes, Kauffeld forces the reader to become aware that there is so much more to the search for snakes than the discovery and capture of specimens that he can never pursue them again with the same detachment from their surroundings as before.

It may well be wished that every young enthusiast for snakes be led to read this book, which constitutes in the reviewer's opinion the soundest indoctrination in existence to both the charm and responsibility of study, however amateurish or professional, of living reptiles in their natural haunts and in captivity. Indeed it would repay perusal even by many experienced herpetologists - as it has the reviewer.

HOBART M. SMITH, Department of Biology, University of Colorado, Boulder.

GRANTS FOR NORTH AMERICAN STUDIES

The American Museum of Natural History has established the Theodore Roosevelt Memorial Fund to "help provide the necessary means of encouraging studies on the North American fauna to which Theodore Roosevelt, 26th President of the United States, devoted so much of his time and energy." Grants, in small amounts, will be made to individuals conducting research in any phase of wildlife conservation, animal ecology, or in related fields of North American natural history included in the activities of the American Museum, and located geographically north of the southern boundary of continental United States. Preferably, grants will be made to younger scientists, particularly to graduate students. Deadline for grants for the current calendar year is 15 April 1969. For application forms and additional information write to the Director, The American Museum of Natural History, Central Park West at 79th Street, New York, New York 10024.

news from institutions

CURRENT HERPETOLOGICAL RESEARCH

Currently five doctoral students at SIU-Carbondale have research interests in herpetology. John S. Garton and Earl W. Harris are studying ecology of semi-aquatic snakes in southern Illinois, particularly Natrix and Agkistrodon piscivorus. Joseph C. Besharse is investigating ontogenetic degeneration of the eyes of Typhlotriton spelaeus, the grotto salamander. James R. Wiley contemplates studying geographic variation and ecology of Cryptobranchus, and Raymond T. Schaaf, Jr. intends to study some aspect of Rana ecology. Ronald A. Brandon has been interested in reproductive ecology of newts and tiger salamanders in southern Illinois, ecology of green tree frogs and a few other amphibians at SIU's Pine Hills Field Station, and is establishing a laboratory breeding colony of Bathysiredon dumerili, the ambystomatid salamander endemic to Lake Patzcuaro, Michoacan, Mexico (Garton spends much time dangling liver before their snouts). A large cistern at the edge of campus has been converted into an underground laboratory (approximately 150 square feet on two levels) suitable for maintaining cave-adapted salamanders for experimental purposes.

members desiderata

Hobart M. Smith, Department of Biology, University of Colorado, Boulder 80302, wishes to obtain one copy of the 77 microcards issued by Meade Natural History Library, Tulane University, constituting a copy of "Tracts, Collected by U. S. National Museum," Vols. 41-44, Reptiles and Batrachians, Vols. I-IV.

Thomas E. Lott, 20th Pvnt Med Unit (SVC) (FLD), APO San Francisco 96227, wishes to obtain any recent reference works on the serpent fauna of Indo-China. Mr. Lott is currently building a collection of preserved snakes from Viet Nam. These specimens will eventually be deposited in a major museum.

V. F. Taylor, 47 Baden Road, Gillingham, Kent, England, wishes to set up a British Committee to control the import of reptiles from other countries. The aim of this Reptile Import Control Council is to provide an early warning system to help safeguard reptile species in danger of extinction either on a local or a total scale.

a sample index

WE HAVE BEGUN TO INDEX THE LISTED TITLES BY SUBJECT, GEOGRAPHY, AND TAXONOMIC ARRANGEMENT, AND EXPECT TO HAVE THIS PUNCH-CARD SYSTEM FULLY OPERATIVE BY THE END OF 1969. ALL OF THE INDEX-TERMS ARE HIERARCHIAL IN ARRANGEMENT -- ALLOWING GENERAL QUESTIONS, FOR EXAMPLE ON THE NATURAL HISTORY OF NEARCTIC AMPHIBIANS, OR ON SUBJECTS AS SPECIFIC AS THE HISTOLOGY OF THE PINEAL ORGAN OF GREEK SPECIES OF LACERTA.

IT IS NOT OUR INTENTION TO PUBLISH SUCH A CROSS-INDEX ON A REGULAR BASIS. THE REQUIREMENTS OF INDIVIDUAL WORKERS ARE TOO VARIED TO FULFILL ALL OF THEM ADEQUATELY BY A GENERAL INDEX. HOWEVER, THE FACILITIES FOR GETTING AT THIS MATERIAL WILL BE READILY AVAILABLE HERE, AND SHOULD GAIN IN USEFULNESS TO ALL AS PAPERS ARE ADDED TO THE SYSTEM THROUGH THE YEARS.

●●●●

AN INDEX TO A VARIED SAMPLE OF THE PAPERS IN THE CURRENT LIST IS PRESENTED BELOW.

THE FIRST LIST OF CITATION-CODES IS OF THOSE TITLES WHICH PERTAIN TO PALEARCTIC AMPHIBIANS AND REPTILES.

THE FULL CITATION IS:

THIOLLAY,J.-M.
1968 ESSAI SUR LES REPACES DU MIDI DE LA FRANCE
DISTRIBUTION - ECOLOGIE
ALAUDA 36(3):179-189.

*** IT IS NOT NECESSARY, OF COURSE, TO APPROACH A PARTICULAR PROBLEM IN THIS STEP-WISE FASHION. THIS ONE COULD HAVE BEEN APPROACHED DIRECTLY BY IMMEDIATE USE OF SPECIFIC TERMS IN EACH OF THE THREE (SUBJECT, GEOGRAPHIC, AND TAXONOMIC) INDICES.

FUTURE SSAR MEETINGS

1969 - SOUTHERN ILLINOIS UNIVERSITY, CARBONDALE

1970 - UNIVERSITY OF MISSOURI, KANSAS CITY

Current Herpetological Titles, V.

By H. G. Dowling, Itzchak Gilboa, and Irene Palser

GENERA OF REPTILES, American Museum of Natural History, New York, New York 10024.

****

THIS FIFTH LIST OF CURRENT HERPETOLOGICAL TITLES (SEE HERPETOLOGICAL REVIEW NUMBERS 2,3,4 & 5 FOR PREVIOUS LISTS) INCLUDES ADDITIONAL TITLES THAT HAVE COME IN DURING THE PERIOD 1 NOVEMBER 1968 THROUGH 1 FEBRUARY 1969. AS BEFORE, A FEW TITLES HAVE BEEN OBTAINED FROM SECONDARY SOURCES, BUT THESE MAKE UP LESS THAN FIVE PER CENT OF THE TITLES LISTED. LIKE THE PREVIOUS LISTS, THIS ONE IS PHOTO-OFFSET REPRODUCTION FROM COMPUTER PRINTOUT.

THE VAST MAJORITY OF LISTED PAPERS IS IMMEDIATELY AVAILABLE TO US. WE ARE BASED AT ONE OF THE GREATEST (AND LIKELY THE MOST ACCESSIBLE) HERPETOLOGICAL LIBRARIES OF THE WORLD. WE DO NOT ANTICIPATE BEING READY TO ACT AS A BIBLIOGRAPHIC SERVICE FOR ANOTHER YEAR. HOWEVER, IF YOU ARE REALLY STUCK FOR A REFERENCE, LET US KNOW: WE WILL SEE WHAT WE CAN DO.

FUTURE: TO THIS DATE THE CURRENT LIST OF TITLES HAS BEEN NO MORE THAN THAT. HOWEVER, WE HAVE BEGUN TO CROSS-INDEX THE 1968 LITERATURE FOR ACCESS THROUGH TAXONOMIC, GEOGRAPHIC, AND SUBJECT AVENUES. WE DO NOT ANTICIPATE PUBLISHING THIS INDEX BUT INSTEAD ARE ATTEMPTING TO COORDINATE OUR EFFORTS WITH BIOLOGICAL ABSTRACTS AND ZOOLOGICAL RECORD. BOTH OF THESE INSTITUTIONS HAVE INDICATED AN INTEREST IN COORDINATING THE INFORMATION OBTAINED HERE WITH THAT DERIVED FROM THEIR OWN SOURCES AND WE ARE STILL EXPLORING THE VARIOUS POSSIBILITIES.

ACKNOWLEDGMENTS: THIS LIST WAS PREPARED WITH THE AID OF THE HERPETOLOGY DEPARTMENT AND THE LIBRARY OF THE MUSEUM, AND THE DEPARTMENT OF ZOOLOGY AND THE COMPUTER LABORATORY OF THE UNIVERSITY OF RHODE ISLAND. WE ARE ESPECIALLY GRATEFUL FOR THE HELP OF JAMES E. BRADLEY AND HARLAN S. HERSEY OF THE COMPUTER LABORATORY. SEVERAL COLLEAGUES HAVE AIDED BY BRINGING ADDITIONAL LITERATURE TO OUR ATTENTION. FORMOST AMONG THESE IS JAMES. A. PETERS, WHO HAS FORWARDED NEARLY TWO HUNDRED REPRINTS TO US FOR INCLUSION. OTHER VALUABLE AID HAS BEEN PROVIDED BY GEORGE J. JACOBS (GOVERNMENT PUBLICATIONS) AND DAVID B. WAKE (OBSCURE JOURNALS).

TOBY F. SHAMAN HAS BECOME AN INTEGRAL COG IN THE MACHINERY OF THE PROJECT, WHILE RICHARD G. ZWEIFEL AND MARGARET S. SHAW, ALSO OF THE DEPARTMENT OF HERPETOLOGY, HAVE AIDED THE PROJECT IN MANY SPECIAL WAYS. NAO SAITO AND ROBERT J. WINTER OF THE DEPARTMENT OF ICHTHYOLOGY, HAVE BEEN VERY HELPFUL WITH TRANSLATIONS FROM ORIENTAL AND SLAVIC JOURNALS. WE ARE GRATEFUL FOR ALL OF THIS HELP. THE PROJECT IS SUPPORTED BY THE NATIONAL SCIENCE FOUNDATION (NSF GN-707).

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles.

FOR DUES INFORMATION

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

FIRST NATIONAL BIOLOGICAL CONGRESS FOR THE U.S.A.

The Governing Board of the American Institute of Biological Sciences approved on 1 September 1968 a resolution to hold National Biological Congresses in 1970, 1971 and 1972. The first Congress will be held in Detroit, Michigan, 6-10 November, 1970.

The world is confronted by a number of threats of unprecedented magnitude. The rapid growth in human population has raised the spectre of a worsening deficit in important world resources. Food, already in short supply, cannot for long be produced in the quantity and at levels of quality essential to the maintenance of our peoples. Air and water, once considered inexhaustible reservoirs, are becoming polluted at an alarming rate. If these and similar problems do not find solutions now, currently existing generations will live with a number of disastrous consequences.

No longer can man ignore these major crises that confront our cities and the nation as a whole.

Biologists must seek solutions to the problems which face us. The decision to initiate a series of National Biological Congresses is a practical and immediate step by biologists to marshall the unique skills and sophisticated techniques of this field of science.

The Congresses will be concerned with Social, Education and Scientific aspects of these problems. The morning sessions will be devoted to interdisciplinary symposia covering the major scientific advances in all areas of Biology. National and International leaders in the biomedical sciences will be invited to participate in these symposia.

Afternoon sessions will be devoted to papers contributed by biologists active in specific research. Progress in areas of biology ranging from molecular, genetic and developmental biology to evolutionary, ecological and environmental sciences will be reviewed. Invitations will be extended to younger scientists to contribute original research papers that will shed additional light on the subjects covered by the major symposia.

Special evening programs, open to the public, will be designed to provide a forum in which the inter-relationships of biology, technology, society and public affairs are considered. Invitations will be extended to local, state and national leaders to participate in these public meetings. Among the topics to be considered for whose solution biological knowledge is vital are water and air pollution, pest control, population pressures, community health, food quality and the effects of drugs on human development and behavior.

Educational and scientific programs will be arranged for local high school and college students who are interested in a career in the biological-medical sciences. In addition to lectures by outstanding scientists, there will be special programs by leading science counsellors who will describe career opportunities in biology.

Exhibits by book publishers and suppliers of scientific equipment will be of interest to scientists. In addition, organized tours for students and the general public are planned in order to give them an opportunity to see the current "tools" used by the biologists.

WILLIAM D. McELROY, President, American Institute of Biological Sciences. (from Biological Abstracts, Volume 49(19): October 1, 1968).

SOCIETY'S DUES ARE INCREASED FOR 1969

At the Society's eleventh annual meeting the Board of Directors voted to increase dues for calendar 1969 as follow: Regular member (U. S. and Canada) - $6. 00; Foreign member - $5. 00; Sustaining member - $8. 00; and institutional subscription - $10. 00. Contributing membership and Life membership remain the same at, respectively, $15. 00 and $100. 00.

New Books & Reprints

Batrachia and Reptilia of Costa Rica by Edward D. Cope. 1967 reprint. Prefaced by Jaime Villa. Available for $1. 50 from: Departamento de Biologia, Universidad de Costa Rica, Ciudad Universitaria, Costa Rica.

Amphibien und Reptilien: Katalog der Subfamilien und höheren Taxa mit Nachweis des ersten Auftretens by Oskar Kuhn. 1967. Available for $11. 00 from: Richard Abel & Co., Inc., P. O. Box 4245, Portland, Oregon 97208.

Snakes: The Keeper and the Kept by Carl Kauffeld. 1968. Available for $5. 95 from Doubleday.

Herpetologica Mexicana by A. F. A. Wiegmann. Berlin, 1834. A 1969 reprint by the Society for the Study of Amphibians and Reptiles. Available for $6. 00 from: Henri C. Seibert, SSAR Publications Secretary, Department of Zoology, Ohio University, Athens, Ohio 45701.

□ □ □ □ □ □

MEMBERS DESIDERATA

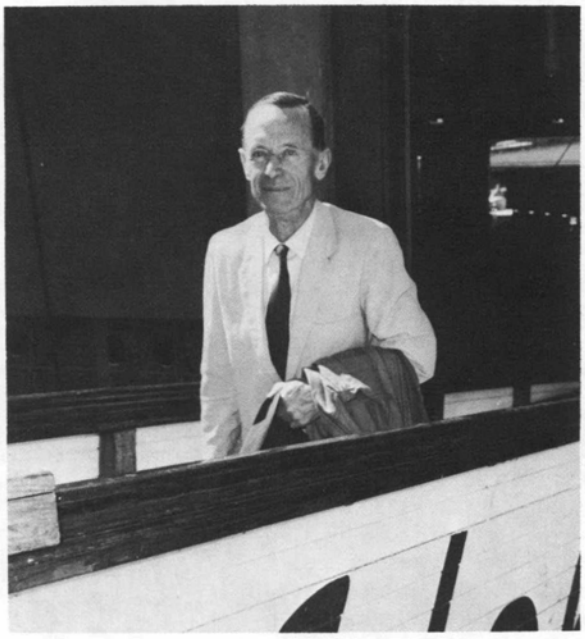
Robert M. Deems, 13 Lawnside Drive, Trenton, New Jersey 08638, wishes to obtain specimens of Sceloporus cyanogenys.

Wayne Busby, 82 - 29th Street, Toronto 14, Ontario, Canada, wishes to obtain adresses of herpetological societies in England and Australia.

NEW HERPETOLOGICAL SOCIETY FORMED

President Howard Lawler announces the formation of the Tennessee Herpetological Society at Nashville. The THS issues a monthly mimeographed bulletin devoted to surveying the herpetofauna of Tennessee. Persons wishing to join the THS may contact: Renee Lawler, Secretary-Treasurer, 1505 Acklen Avenue, Nashville, Tennessee 37212.

HAMPTON WILDMAN PARKER



Dr. H. W. Parker, C.B.E., D.Sc., B.A., F.L.S., F.Z.S. (1897 - 1968) was born at Giggleswick, Yorkshire, the elder son of Stephen Parker, a schoolmaster, and Bertha Leonora née Hampton. He married in 1924 Nora, daughter of Frederick William Whatling, property developer, and Rebecca, née Newman.

He received his early education in Yorkshire and at Christ's Hospital. In the year 1919, having gained a Natural Science Scholarship, he went up to Cambridge University where at Selwyn College he received a first class degree in zoology, chemistry, botany, and the college Prize Bachelors. He also distinguished himself in sport, winning his college colours in athletics, rugby and rowing. During the 1914 - 1918 war he enlisted in the Army, was commissioned in the Duke of Wellington's Regiment and was wounded on service in France.

His connection with the British Museum (Natural History) London began in 1923, when he was appointed as Assistant Keeper in charge of the Amphibia and Reptilia Section. For a short period during the 1939 - 1945 war he was seconded to the Admiralty where he was a Temporary Naval Store Officer. After returning to the museum he was, in 1947, promoted to be Keeper of the Department of Zoology. He retired from the museum service in 1957.

H. W. Parker wrote extensively on the systematics of his groups from the time he entered the museum and he was still engaged in writing shortly before his untimely death. He had a clear, logical mind and the gift of deep concentration; his published works show an increasing maturity, depth of understanding and a new approach to systematics. He was a founder member and a secretary of the Systematics Association and also served for a short time as Honorary Treasurer. Among his most important works are the monographs on the Australian Leptodactylid frogs, Frogs of the family Microhylidae, and on lizards and snakes of Somaliland.

During the period in the museum, his opinions and services were in constant demand both by colleagues and younger workers and his time was freely given. Correspondence was world-wide and his replies, meticulous in attention to detail and carefully considered, were much appreciated. Appreciation was shown particularly by American colleagues and he was made an Honorary Foreign Member of the American Society of Ichthyologists and Herpetologists. In 1949 the University of Leiden awarded him a Doctorate of Science. At the examination ceremony the audience had unbounded admiration for his knowledge and ability to communicate his thoughts. Some of his scientific opinions and published works may, of course, invite some criticism, but will receive more praise. The quality of his work is obvious and it is as a scientist that he will be more widely remembered. He was a member of Council and of several committees of the Zoological Society of London and a Council member of the Linnean Society for many years.

There are other less known facets of his character. H. W. Parker was a competent administrator and during his ten years as Keeper of Zoology this became clear. His efforts were directed mainly towards rehabilitation and reconstruction after the upsets of the war. A difficult period, from which he emerged scarred but victorious and for which retired and present staff have much to thank him. He had also a breadth of mind which allowed him to delegate responsibilities and to give and sustain support from a distance. A practical side of his abilities also emerged. Soon after he began his museum service, transfer of the collections of preserved amphibia and reptilia from the old store-rooms to a new building took place, when he was not slow in doffing his coat and taking a share in some of the more physically arduous and less interesting sides of museum management. This ability was again brought into use during the early period of the 1939 - 1945 war in making preparation for the protection of the staff and the building of safety rooms. With carpenter's tools in his hand in place of the usual calipers and scalpel, H. W. Parker was a joy to behold. He had an integrity of mind and purpose which coloured all his endeavours and a personality

that commanded loyalty and a deep respect. His love of the sea was apparent in the care given to his sailing boats, one named Caretta and another Black Bottom. He was a competent navigator and took many happy and eventful voyages across the English Channel and into the inland waters of the continent of Europe.

A catalogue of published works and a recital of some achievements cannot alone provide an adequate picture of his personality. H. W. Parker disliked the banalities of small talk and was naturally modest and retiring. A close association of over 30 years allows me to feel and to say sincerely, that I am proud to have known him and I regret his passing.

He was aged 71 years and is survived by his wife.

JAMES C. BATTERSBY

FRED RAY CAGLE (1915 - 1968)

On 8 August 1968, Dr. Fred R. Cagle died at the age of 53. Dr. Cagle was currently professor of biology and Vice-President of Tulane University, New Orleans. He received his bacculaureate degree in 1937 at Southern Illinois Normal University, and his Master's degree at the University of Michigan in 1938. He served as a university fellow (1941-43) and Rackham fellow (1942-43) at Michigan where he received his doctorate degree in zoology in 1943.

DR. FRED R. CAGLE

After serving as Captain in the armed forces from 1943 to 1946, he accepted a position as associate professor of zoology at Tulane University. In 1949 he was elevated to professor of zoology. In 1959 he was appointed research coordinator at Tulane University until his elevation to Vice-President of that institution.

Dr. Cagle's research was varied and included such areas as growth of reptiles, temperature relationships in poikilothermic vertebrates, natural history and systematics of reptiles, and education. He also expressed deep interest and concern over the state of biological communication in this country. He served as editor of Copeia, The American Midland Naturalist, and Biological Abstracts, and was one of the founders of the Conference of Biological Editors.

The list of societies and organizations of which Dr. Cagle was a member is lengthy; some of the more important ones were the Society of Systematic Zoology, American Society of Ichthyologists and Herpetologists, Society of Mammalogists, Wilson Ornithological Club, Society for the Study of Evolution, the Wildlife Society, and the Cooper Ornithological Society. In addition, Dr. Cagle was one of the initial sustaining members of the Society for the Study of Amphibians and Reptiles.

JOSEPH T. COLLINS, Museum of Natural History, University of Kansas, Lawrence 66044

□ □ □ □ □

OF INTEREST TO PERSONS WISHING TO BUILD A HERPETOLOGICAL LIBRARY . . . . . .

The following books and reprints are available at the prices listed. Checks should be made payable to Joseph T. Collins, and mailed to: Museum of Natural History, University of Kansas, Lawrence 66044. Upon receipt of payment, books will be forwarded postpaid to purchasers.

Klassen und Ordnungen des Thier-Reichs, Amphibien. 1873-1878. in H. G. Bronn, for $40.00

Essai sur la Physionomie der Serpens. 1837. by H. Schlegel, for $18.00

Poisonous Snakes of North America. 1893. by L. Stejneger for $9.00

Amphibia of Western North America. 1928. by J. R. Slevin for $13.00

Philippine Amphibia. 1920. by E. H. Taylor (original, not the reprint) for $12.00

Ca. 250 reprints and articles by over 50 authors, all dealing with herpetology, for $15.00

ALPHABETIC LIST OF JUNIOR AUTHORS

ON THE CODES: THE "SEE" CODES REFER BACK TO THE LISTS OF FULL CITATIONS THAT ARE ARRANGED ALPHABETICALLY BY THE NAME OF THE SENIOR AUTHOR WITHIN THE LIST FOR 1967 OR 1968. THE CODE IS DERIVED FROM THE FIRST THREE LETTERS OF THE SENIOR AUTHOR'S FAMILY NAME AND THE INITIAL LETTERS OF HIS (FIRST TWO) GIVEN NAMES. THE NUMERALS AFTER THE DASH ARE THE YEAR OF PUBLICATION (MINUS THE INITIAL "1") AND THE THREE LETTERS WHICH FOLLOW ARE THE INITIAL LETTERS OF THE FIRST THREE SIGNIFICANT WORDS IN THE TITLE. THE NUMERALS AFTER THE COLON REFER TO THE INITIAL PAGE NUMBER OF THE ARTICLE. THIS CODE, DERIVED ENTIRELY FROM THE ARTICLE AT HAND, DOES NOT FOLLOW STRICT ALPHABETICAL ORDER, BUT IT IS EXPLICIT. THE LIST BELOW WAS ARRANGED BY CODE: THUS IT IS NOT STRICTLY ALPHABETIC. ***

FUTURE SSAR MEETINGS

1969 - SOUTHERN ILLINOIS UNIVERSITY, CARBONDALE

1970 - UNIVERSITY OF MISSOURI, KANSAS CITY

WALLACE,H.
1968 FROG GERM CELLS
SCIENCE 161(3839):396.

WALKER,J.MARTIN AND HARRY L.TAYLOR
1968 GEOGRAPHICAL VARIATION IN THE TEIID LIZARD CNEMIDOPHORUS HYPERYTHRUS. I. THE CAERULEUS-LIKE SUBSPECIES
AMER MIDLAND NAT 80(1):1-27, 1 FIG., 10 TAB.

WALLACE,R.A. AND D.W.JARED
1968 STUDIES ON AMPHIBIAN YOLK. VII. SERUM PHOSPHOPROTEIN SYNTHESIS BY VITELLOGENIC FEMALES AND ESTROGEN-TREATED MALES OF XENOPUS LAEVIS
CAN J BIOCHEM 46(8):953-959, 4 FIG.

WALSH,L.A.
1968 (CAPTIVE BIRTH OF CORALLUS ANNULATUS)
VIRGINIA HERPETOL SOC BULL (55):4.

WATLINGTON,C.O., J.A.SPATH,JR., E.R.BERRY AND E.G.HUF
1968 SECRETORY RESPONSES OF FROG SKIN TO CHEMICAL STIMULATION
FED PROC 27(2):233. (ABSTR)

WATLINGTON,CHARLES O., PATRICK K.BURKE AND HERSCHEL L.ESTEP
1968 CALCIUM FLUX IN ISOLATED FROG SKIN; THE EFFECT OF PARATHYROID SUBSTANCES
PROC SOC EXP BIOL MED 128(3):853-856, 2 FIG., 2 TAB.

WEHNER,WOLFGANG
68 FARBVERAENDERUNGEN BEI CALOTES?
AQUAR TERR 15(8):281.

WEIMANN,J.N.
1968 SNAKE PARK REPORT
ANN REP PORT ELIZABETH MUS 1967:11-12, 1 FIG.

WEIMANN,JOHN
1968 SOUTH AFRICAN SNAKES
EAST CAPE NAT 1968(34):24-26.

WELSH,JOHN H.
1968 DISTRIBUTION OF SEROTONIN IN THE NERVOUS SYSTEM OF VARIOUS ANIMAL SPECIES, P. 171-188, 3 FIG., IN, SILVIO GARATTINI AND PARKHURST A.SHORE (EDS) ADVANCES IN PHARMACOLOGY, VOL. 6, PART A. ACADEMIC PRESS, NEW YORK.

WENGER,T. AND I.TOERK
1968 STUDIES ON THE ORGANON VASCULOSUM LAMINAE TERMINALIS. II. COMPARATIVE MORPHOLOGY OF THE ORGANON VASCULOSUM LAMINAE TERMINALIS OF FISHES, AMPHIBIA, REPTILIA, BIRDS AND MAMMALS
ACTA BIOL ACAD SCI HUNG 19(1):83-96, 12 FIG.

WERNER,YEHUDAH L.
1968 DISTRIBUTION OF THE SAHARAN SPHENOPS SEPSOIDES (REPTILIA: SCINCIDAE) IN ISRAEL AND JORDAN
HERPETOLOGICA 24(3):238-242, 3 FIG.

WHEELER,FRANCIS
1968 TREATMENT OF SNAKE BITES, P. 389, IN, REGINALD WAGSTAFFE AND J.HAVELOCK FIDLER, THE PRESERVATION OF NATURAL HISTORY SPECIMENS. VOL. 2. ZOOLOGY-VERTEBRATES, BOTANY, GEOLOGY.
H.F. AND G.WITHERBY LTD, LONDON.

WHITFORD,WALTER G. AND ROBERT E.SHERMAN
1968 AERIAL AND AQUATIC RESPIRATION IN AXOLOTL AND TRANSFORMED AMBYSTOMA TIGRINUM
HERPETOLOGICA 24(3):233-237, 1 FIG., 2 TAB.

WHITNEY,ELINOR, HUGO JAMNBACK, ROBERT G.MEANS AND THOMAS H.WATTHEWS
1968 ARBOVIRUS REACTIVITY IN SERUM FROM AMPHIBIANS, REPTILES, BIRDS, AND MAMMALS
AMER J TROP MED HYG 17(4):645-650.

WITSCHI,E.
1968 HEREDITY AND CYTOLOGY OF SEX AS EXAMINED IN FROGS
NASA TECH TRANSL (TT-F-11685):1-33. (ENG TRANS FROM GERM, Z INDUKT ABSTAMM VERERB 28(1):31-68 (1922))

WITTLIFF,JAMES L.
1968 SEPARATION OF TOAD VENOM CONSTITUENTS ON SILICA GEL IMPREGNATED GLASS FILTER PAPER
TOXICON 6(1):73-74, 2 TAB.

WOLEDGE,R.C.
1968 THE ENERGETICS OF TORTOISE MUSCLE
J PHYSIOL (CAMBRIDGE) 197(3):685-707, 9 FIG., 5 TAB.

WOLFF,J., H.SALABE, M.AMBROSE AND P.REEC LARSEN
1968 THE BASIC PROTEINS OF COBRA VENOM. II. MECHANISM OF ACTION OF COBRAMINE B ON THYROID TISSUE
J BIOL CHEM 243(6):1290-1296.

WOODLAND,H.R. AND J.B.GURDON
1968 THE RELATIVE RATES OF SYNTHESIS OF DNA, SRNA AND RRNA IN THE ENDODERMAL REGION AND OTHER PARTS OF XENOPUS LAEVIS EMBRYOS
J EMBRYOL EXP MORPHOL 19(3):363-385, 10 FIG.

WOODRUFF,D.S.
1968 THE GENUS PSEUDOPHRYNE
AUSTR SOC HERPETOL NEWSLETT (8):8. (TITLE ONLY)

WOODWARD,DONALD J.
1968 ELECTRICAL SIGNS OF NEW MEMBRANE PRODUCTION DURING CLEAVAGE OF RANA PIPIENS EGGS
J GEN PHYSIOL 52(3):509-531, 12 FIG.

WORTHINGTON,RICHARD C.
1968 OBSERVATIONS ON THE RELATIVE SIZES OF THREE SPECIES OF SALAMANDER LARVAE IN A MARYLAND POND
HERPETOLOGICA 24(3):242-246, 1 FIG.

WUENDSCH,L., W.HIMSTEDT AND H.BORNSCHEIN
1968 E- UND I-NETZHAEUTE VON URODELEN
EXPERIENTIA 24(7):731-733, 2 FIG.

YIAMOUYIANNIS,J.A. AND J.A.CAIN
1968 THE APPEARANCE OF GANGLIOSIDE DURING EMBRYOLOGICAL DEVELOPMENT OF THE FROG
J NEUROCHEM 15(7):673-676.

YOUNG,RICHARD S. AND JOHN W.TREMOR
1968 THE EFFECT OF WEIGHTLESSNESS ON THE DIVIDING EGG OF RANA PIPIENS
BIOSCIENCE 18(6):609-615, 7 FIG., 3 TAB.

ZAFFAGNINI,FULVIO
1968 ASPETTI PARTICOLARI DELL'INTERSESSUALITA IN RANA ESCULENTA
ARCH ITALIANO ANAT EMBRYOL 73(2):99-113, 15 FIG.
(ITAL, ENG ABSTR)

ZAPPALORTI,ROBERT
1968 LUCK IN THE BARRENS
HERP 5(1):14-18.

ZEILLER,WARREN
1968 MAINTENANCE OF THE YELLOWBELLIED SEASNAKE, PELAMIS PLATURUS, IN CAPTIVITY
DRUM AND CROAKER 68(3):27-30, 1 TAB.

ZIMINSKI,STANLEY W.
1968 AN ADDITIONAL RECORD OF THE EASTERN MUD TURTLE FROM LONG ISLAND
ENGELHARDTIA 1(3):28.

ZINGG,ALFRED
1968 DIE KYKLADENVIPER VIPERA LEBETINA SCHWEIZERI WERNER, 1935
AQUA TERRA 5(9):73-76, ILL.

ZUG,GEORGE R.
1968 GEOGRAPHIC VARIATION IN RHINEURA FLORIDANA (REPTILIA: AMPHISBAENIDAE)
BULL FLA STATE MUS 12(4):185-211, 6 FIG., 4 TAB.

ZWEIFEL,RICHARD G.
1968 REPRODUCTIVE BIOLOGY OF ANURANS OF THE ARID SOUTHWEST, WITH EMPHASIS ON ADAPTATION OF EMBRYOS TO TEMPERATURE
BULL AMER MUS NAT HIST 140(1):1-64, 21 FIG., 10 TAB., 2 PL.

ZWICK,H. AND A.M.GRANDA
1968 BEHAVIORALLY DETERMINED DARK ADAPTATION FUNCTIONS IN THE TURTLE, PSEUDEMYS
PSYCHONOMIC SCI 11(7):239-240, 3 FIG.

FINAL LIST OF TITLES FOR **1967**

AGARKOV,G.B. AND V.I.BUROVA
1967 CARACTERES PARTICULIERS DU RESEAU VASCULAIRE, DE L'APPAREIL NERVEUX ET DES GLANDES DE L'OESOPHAGE DE CERTAINS VERTEBRES
DOPOV AKAD NAUK UKR RSR 29(2):151-154. (UKR, ENG SUMM)

AKCASU,A., J.PARTISS AND J.E.P.TOMAN
1967 THE EFFECT OF MONO AND DISACCHARIDES ON SOME PROPERTIES OF FROG SCIATIC NERVE
FED PROC 26(2):403. (ABSTR)

ALCALA,ANGEL C. AND WALTER C.BROWN
1967 POPULATION ECOLOGY OF THE TROPICAL SCINCOID LIZARD, EMOIA ATROCOSTATA, IN THE PHILIPPINES
COPEIA 1967(3):596-604, 2 FIG.

ALEXANDRE,H.
1967 EFFETS DES RAYONS X SUR LE DEVELOPPEMENT DES JEUNES EMBRYONS DE PLEURODELES WALTLII, SUR LE DNA CYTOPLASMIQUE ET SUR LES BIOSYNTHESES AU COURS DE LA SEGMENTATION
BULL CL SCI ACAD ROY BELG (5)53:1088-1105, 7 FIG.

ALFORD,DON B.
1967 CLEMMYS MUHLENBERGI
BULL CHICAGO HERPETOL SOC 2(4):1.

ALVAREZ,TICUL AND ELIEZER MARTIN
1967 DESCRIPCION DE UNA NUEVA ESPECIE DE PSEUDOEURYCEA DE OAXACA MEXICO (AMPHIBIA:CAUDATA)
ACTA ZOOL MEX 9(1):1-9, 2 FIG., 1 TAB.

ALVAREZ,TICUL AND ELIEZER MARTIN
1967 ZITACUARO, MICHOACAN, UNA LOCALIDAD MAS NORTENA PARA DERMOPHIS MULTIPLICATUS OAXACAE (AMPHIBIA: CAECILIIDAE)
ACTA ZOOL MEX 9(2):1-4.

ANDRZEJEWSKI,HENRYK
1967 TRWALE OKALECZENIA ZABY TRAWNEJ (RANA TEMPORARIA L.) PRZEZ ZABE SMIESZKE (R. RIDIBUNDA PALL.)
PRZEGL ZOOL 11(1):44-45, 2 FIG. (ENG SUMM)

ANDERSON,JAMES D. AND ROBERT V.GIACOSIE
1967 AMBYSTOMA LATERALE IN NEW JERSEY
HERPETOLOGICA 23(2):108-111.

Current Herpetological Titles, IV 1968

By H. G. Dowling, Itzchak Gilboa, and Irene Palser

GENERA OF REPTILES, American Museum of Natural History, New York, New York 10024.

****

THIS FOURTH LIST OF CURRENT HERPETOLOGICAL TITLES (SEE HERPETOLOGICAL REVIEW NUMBERS 2, 3, & 4 FOR PREVIOUS LISTS) INCLUDES ADDITIONAL TITLES FROM 1967 THAT HAVE COME TO OUR ATTENTION AND 1968 TITLES THAT HAVE COME IN DURING THE PERIOD 5 AUGUST THROUGH 1 NOVEMBER. AS BEFORE, A FEW TITLES HAVE BEEN OBTAINED FROM SECONDARY SOURCES, BUT THESE MAKE UP LESS THAN FIVE PER CENT OF THE TITLES LISTED. LIKE THE PREVIOUS LISTS, THIS ONE IS PHOTO-OFFSET REPRODUCTION FROM COMPUTER PRINTOUT.

ONE POINT THAT HAS NOT BEEN EMPHASIZED TO DATE IS THAT THE VAST MAJORITY OF LISTED PAPERS IS IMMEDIATELY AVAILABLE TO US. WE ARE BASED AT ONE OF THE GREATEST (AND LIKELY THE MOST ACCESSIBLE) HERPETOLOGICAL LIBRARIES OF THE WORLD. WE DO NOT ANTICIPATE BEING READY TO ACT AS A BIBLIOGRAPHIC SERVICE FOR ANOTHER YEAR. HOWEVER, IF YOU ARE REALLY STUCK FOR A REFERENCE, LET US KNOW: WE WILL SEE WHAT WE CAN DO.

FUTURE: TO THIS DATE THE CURRENT LIST OF TITLES HAS BEEN NO MORE THAN THAT. HOWEVER, WE HAVE BEGUN TO CROSS-INDEX THE 1968 LITERATURE FOR ACCESS THROUGH TAXONOMIC, GEOGRAPHIC, AND SUBJECT AVENUES. WE DO NOT ANTICIPATE PUBLISHING THIS INDEX BUT INSTEAD ARE ATTEMPTING TO COORDINATE OUR EFFORTS WITH BIOLOGICAL ABSTRACTS AND ZOOLOGICAL RECORD. BOTH OF THESE INSTITUTIONS HAVE INDICATED AN INTEREST IN COORDINATING THE INFORMATION OBTAINED HERE WITH THAT DERIVED FROM THEIR OWN SOURCES AND WE ARE EXPLORING THE VARIOUS POSSIBILITIES.

ACKNOWLEDGMENTS: THIS LIST WAS PREPARED WITH THE AID OF THE HERPETOLOGY DEPARTMENT AND THE LIBRARY OF THE MUSEUM, AND THE DEPARTMENT OF ZOOLOGY AND THE COMPUTER LABORATORY OF THE UNIVERSITY OF RHODE ISLAND. WE ARE ESPECIALLY GRATEFUL FOR THE HELP OF JAMES E. BRADLEY AND HARLAN S. HERSEY OF THE COMPUTER LABORATORY. SEVERAL COLLEAGUES HAVE AIDED BY BRINGING ADDITIONAL LITERATURE TO OUR ATTENTION. FOREMOST AMONG THESE IS JAMES. A. PETERS, WHO HAS FORWARDED NEARLY TWO HUNDRED REPRINTS TO US FOR INCLUSION. OTHER VALUABLE AID HAS BEEN PROVIDED BY GEORGE J. JACOBS (GOVERNMENT PUBLICATIONS), DAVID B. WAKE (OBSCURE JOURNALS), AND SHERMAN A. MINTON (MEDICAL JOURNALS). TOBY F. SHAMAN HAS JOINED THE PROJECT RECENTLY, WHILE RICHARD G. ZWEIFEL AND MARGARET S. SHAW, ALSO OF THE DEPARTMENT OF HERPETOLOGY, HAVE AIDED THE PROJECT IN MANY SPECIAL WAYS. NAO SAITO AND ROBERT J. WINTER OF THE DEPARTMENT OF ICHTHYOLOGY, HAVE BEEN VERY HELPFUL WITH TRANSLATIONS FROM ORIENTAL AND SLAVIC JOURNALS. WE ARE GRATEFUL FOR ALL OF THIS HELP. THE PROJECT IS SUPPORTED BY THE NATIONAL SCIENCE FOUNDATION (NSF GN-707).

THREE LISTS ARE GIVEN BELOW: 1) CURRENT TITLES FOR 1968, 2) A FINAL LIST OF TITLES FOR 1967, AND 3) A LIST OF JUNIOR AUTHORS. *** (SEE NOTE AT END.)

CURRENT TITLES FOR 1968

ACEVEDO GONZALEZ,MANUEL
1968 ESTUDIO ESPELEOLOGICO DE LA CUEVA DEL VAHO O BAO, BOCA DE JARUCO, HABANA
MEM FAC CIENC UNIV HABANA (BIOL) 1(5)1:33-54, 13 FIG. (ENG SUMM)

ADLER,RICHARD
1968 ANOTHER METHOD OF FEEDING CAPTIVE SNAKES
HERP 4(5):19.

AGRAWAL,VINOD
1968 ON SOME TREMATODE PARASITES OF AMPHIBIA FROM LUCKNOW
REV BIOL TROP 15(1):1-11, 8 FIG.

AISENSTADT,T.B. AND T.A.CETTLAFF
1968 THE FINE STRUCTURE OF THE FROG'S OOCYTE AT THE MATURATION PERIOD
TSITOLOGIA 10(7):789-797, 4 FIG. (RUSS, ENG ABSTR)

ALBUQUERQUE,E.X., S.H.CHUNG AND D.OTTOSON
1968 TETRODOTOXIN ON THE ISOLATED MUSCLE SPINDLE OF FROG
FED PROC 27(2):407. (ABSTR)

ALLEN,ANDREW
1968 USES OF THE GREENHOUSE IN REPTILE KEEPING
AQUARIST AND PONDKEEPER 33(5):495.

ALLEN,JOHN H.
1968 LEATHERBACKS IN NG /NEW GUINEA/
PACIFIC ISLANDS MON 39(8):61.

ALTNER,H. AND W.MUELLER
1968 ELEKTROPHYSIOLOGISCHE UND ELEKTRONENMIKROSKOPISCHE UNTERSUCHUNGEN AN DER RIECHSCHLEIMHAUT DES JACOBSONSCHEN ORGANS VON EIDECHSEN (LACERTA)
Z VERGL PHYSIOL 60(2):151-155, 2 FIG. (ENG SUMM)

ANDERSON,JOHN R. AND STEPHEN C.AYALA
1968 TRYPANOSOME TRANSMITTED BY PHLEBOTOMUS: FIRST REPORT FROM THE AMERICAS
SCIENCE 161(3845):1023-1025, 1 FIG.

ANDRUSHKO,A.M.
1968 NEW SPECIES OF ALSOPHYLAX KASHKAROVI SP. N. (REPTILIA, SAURIA, GEKKONIDAE) FROM CENTRAL ASIA
ZOOL ZH 47(2):308-311. (RUSS)

ANGELIER,E. AND M.-L.ANGELIER
1968 OBSERVATIONS SUR LE DEVELOPPEMENT EMBRYONNAIRE ET LARVAIRE DE RANA TEMPORARIA L. /BATRACIEN, ANOURE/
ANN LIMNOL 4(1):113-131, 5 FIG. (FR., ENG ABSTR)

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles.

SEE PAGE 10 OF THIS ISSUE

FOR DUES INFORMATION

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

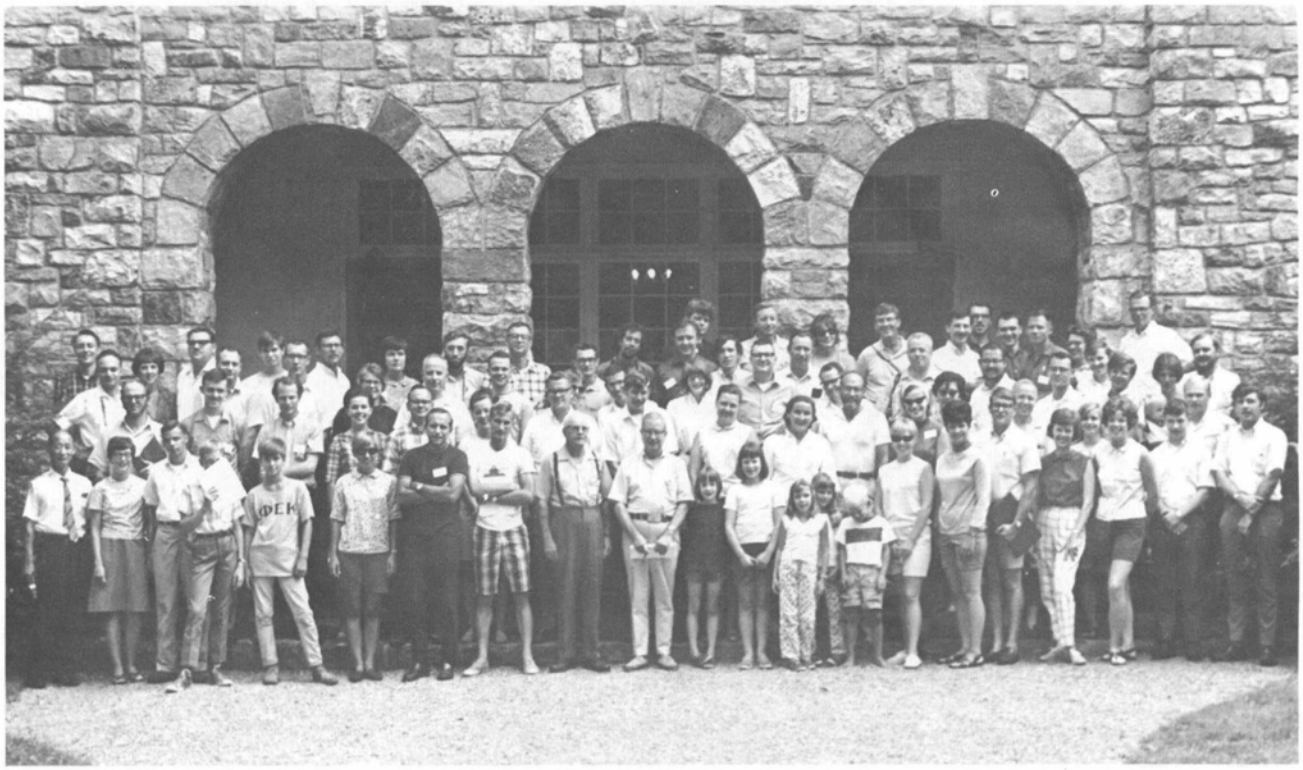
REPORT ON SSAR MOUNTAIN LAKE MEETING



The Society's eleventh annual meeting was held at the University of Virginia's Mountain Lake Biological Station in the Appalachian Mountains near Blacksburg, Virginia, on 23-25 August 1968. The cool climate at 4000 feet and the relaxed atmosphere of the sessions combined to make this perhaps the most enjoyable of all Society meetings. A total of 92 persons attended.

The Board of Directors and the Editorial Board met Friday evening; Chairman N. Bayard Green presided. Present for the Board meeting were: Chairman Green, Joseph T. Collins, Henri C. Seibert, Lowell P. Orr, James C. List, Robert E. Gordon, Barry D. Valentine, J. P. Kennedy, Kraig K. Adler, George R. Zug; James Organ and Herndon G. Dowling were visitors. After hearing a report by Dowling on computerized literature lists, the Board moved to (1) increase dues for 1969, (2) appoint a committee to revise the Constitution, and (3) copyright Journal of Herpetology several budgetary items were also discussed. Concurrently, behavioral films were being shown in the Station's auditorium and an evening field trip to Wind Rock was held.

Herndon Dowling and James Vial presided over the paper sessions on Saturday, including invited lectures by Richard Highton and Carl Gans (abstracts appear in the Journal of Herpetology 2(3-4), 1968). In the evening, a party was held and additional behavioral films were shown. On Sunday, two field trips were held: (1) an all-day trip to Whitetop-Mt. Rogers, and (2) a local trip to the "Cascades" (see Herpetological Review no. 2, 1968).

Several exhibits were open throughout the course of the meeting. The live specimens exhibit, organized by Harry Jopson, included representatives of most Appalachian species of reptiles and amphibians, including all three genera of desmognathine salamanders. The photographic display included over 150 color and black-and-white photographs from sixteen sources. Franklin Tobey of the Virginia Herpetological Society exhibited his Society's detailed distribution maps for Virginia reptiles and amphibians.

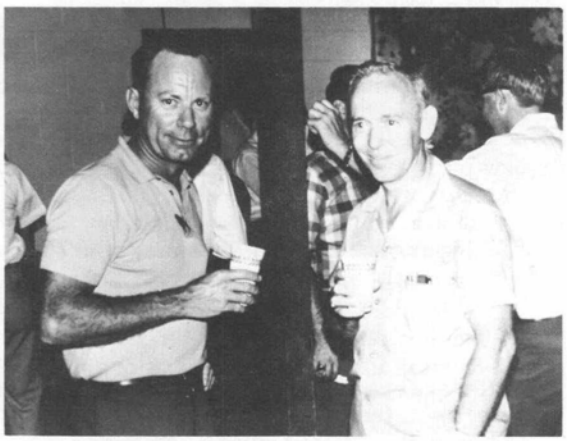
The Society wishes to publicly thank those institutions and individuals who contributed to the success of this meeting. First, to the authorities

1968 MEETING GROUP PHOTOGRAPH. Left to right, ROW 1: Hajime Fukada, Margaret Harrison, Julian Harrison, Scott Highton, Blase Bickett, Patricia Forster, Gordon Forster, Claire Zurbuch, Glenn Gentry, Bayard Green (Society Chairman), Sylvia Organ, Linda Organ, Susan Valentine, Nancy Valentine, Jon Zug, Pat Zug, Maxine Stotler, Chris Stotler, Joan List, Barbara List, Douglas Scherzer, Kraig Adler (Society Editor of Facsimile Reprints). ROW 2: Joseph T. Collins (Society Secretary-Treasurer), Philip Carter, Stevan Arnold, Gerry Orr, Lowell Orr (Society Director), Barbara Maple, Ray Ashton, George Zug (Society Index Editor), Della Organ, Buena Valentine, Barry Valentine, Dolores Adler, Mabel Gans, James List (Society Associate Publications Secretary), Sarah Freeman, Howard Freeman (with Elaine Freeman in arm). ROW 3: Yehudah Werner, Richard Highton, Ralph Pfingsten, Linda Pfingsten, Franklin Tobey, William Maple, Barbara Bayless, Laurence Bayless, Caroline Huheey, James Huheey, Benjamin Banta, Carl Gans, Jack McCoy, Charles Mueller, Olav Oftedal, Linda Dennis, David Dennis. ROW 4: James Organ (Meeting Co-Chairman), Susan Woods, John Woods, Tim Bickett, Dan Swihart, Margaret Stewart, Jack Brooks, Gene Schroeder, Michael Sebetich, Steven Weinkselbaum, Michael Hrynko, Pat Kennedy (Society Editor of the Journal), Peter Mundel, Herndon Dowling, Henri Seibert (Society Publications Secretary), Madlyn Dowling, Robert Gordon, Norton Rubenstein, Tom Scanlon, Steve Tilley, Bill Brode, Mary Tilley, Jim Stewart, Harry Jopson (Meeting Co-Chairman). Present but not in photograph: Marvin Bobes, Hazel Borin, John Caruso, Lloyd Fitzpatrick, Carl Freeman, Helen Gentry, Lyford Greene, Barry Hinderstein (photographer), Mary List, David Snyder, Juanita Snyder, James Vial. Total, 92 persons.

of the University of Virginia, particularly the Station's directors, J. J. Murray, Jr. and James L. Riopel, for their untiring efforts and courtesy to us. Second, to the co-chairmen of the meeting committee, James Organ and Harry Jopson, who, more than anyone else, deserve our gratitude, and to the members of their committee, Stevan Arnold, Alice Makielski, and Kraig Adler. Our thanks also, to the invited lecturers, Drs. Highton and Gans, and to their discussants, Robert Gordon and George Zug. The Institut für Wissenschaftlichen Film (Göttingen), Edward W. Dempsey (Columbia University), E. C. Amoroso (Royal Veterinary College, London), and The University of Michigan kindly loaned the films. Finally, to those whose photographs generated lively discussions, our thanks for their time in preparing their reproductions for the meeting; these persons were Charles Mohr, Margaret Stewart, Ralph Sinclair, Isabelle Hunt Conant, Sherman and Madge Minton, Stephen Tilley, Glenn Gentry, Robert Mertens, Hajime Fukada, James Organ, George Nace, Dale Hoyt, James Huheey, Harry Jopson, Lowell Orr, and Kraig Adler.

more from mountain lake

Herndon Dowling (left) and Glenn Gentry enjoy the pleasant surroundings.



Carl Gans (left) and Hajime Fukada prepare to photograph the varied and beautiful landscape at Mountain Lake.

A crowd awaits further photo instructions in front of the Main Laboratory Building at Mountain Lake.

N. Bayard Green (sitting), Richard Highton (center-standing), and Harry Jopson (Meeting Co-Chairman) relax in the woodland setting of the Biological Station at Pembroke, Virginia.

Our "informal" Saturday night get-together offers a convivial atmosphere as well as refreshment to Jim Vial (left) and Jim List.

TERRA ALTA BIOLOGICAL STATION

Biological stations are becoming an important part of universities throughout the country and West Virginia University's Terra Alta Biological Station (TABS) has the potential of becoming one of the finest.

A biological station is a rather odd creature -- it's only a place to eat, sleep and study but good ones are hard to find. The key to a good station is location, and TABS seems to have found one of the best in the East.

A good location for a biological station means one that is close to a wide variety of plants and animals in their natural state. A zoo or an arboretum is adequate for special purposes; but biology students need to visit a great variety of nature's living laboratories.

Within an hour's drive from TABS there is a mountain-top swamp at Cranesville, native cacti along Patterson Creek in Mineral County, a virgin forest at Cathedral State Park and the wild Cheat River.

TABS is on a 67-acre tract about a mile from Terra Alta, Preston County, and is at an elevation of 2, 625 feet (1, 800 feet higher than Morgantown). Plants and animals at the station are typical of the mid-Appalachian region.

WVU's Department of Biology has been conducting summer field courses since 1926, but until it moved to Terra Alta in 1962 there was no permanent station. Since that time a modest but steady building program has been under way.

Last year a new laboratory, a restroom and shower facility and a Maine Cedar Log residence building were erected. This year a new recreation shelter and a complete building renovation were accomplished.

"TABS has adequate facilities for teaching -- what we need now is some space for research and faculty housing," observed Professor Robert L. Birch, director of TABS.

The need for faculty housing results from a new policy of inviting professors from other schools to teach courses. Recruiting visiting professors for summer courses is usually easy, but without housing for their families, many won't accept an appointment.

Research facilities at TABS are needed to meet the demands of WVU graduate students and staff and to provide space and equipment for post-doctoral research workers from other universities. Many want to spend the summer on studies related to this rather unique area.

This summer the curriculum was expanded from a single five-week session to two five-week sessions. In the first session Professor W. Newman Bradshaw gave a course in field ecology and Professor Patrick J. Kennedy of the University of Texas gave a course in herpetology.

In the second session Professor Charles H. Baer gave a course on plant communities and Professor Birch conducted field studies on invertebrates. Research in botany and zoology was performed by graduate students during both sessions.

One of the most interesting living laboratories in the TABS area is the Cranesville Swamp Nature Sanctuary. To the uninitiated it looks like a formidable swamp. But to a biologist or an interested layman, it's a living museum.

The swamp includes examples of northern coniferous (pines, spruce, etc.) forests surrounded by the typical hardwood (trees with broad leaves that fall in autumn) forests of mid-Appalachia. Coniferous forests lie between the tundra and the hardwoods and during the Ice Age, 10 to 25 thousand years ago, they retreated southward.

As the ice sheets melted the conifers moved back north and except in a few cases in mid-Appalachia, as at Cranesville, were replaced by the hardwoods. Other examples of these Ice Age islands are Cranberry Glades in Pocahontas County and Canaan Valley in Tucker County.

Cranesville Swamp lies at an altitude of 2, 500 feet and is situated in a bowl-shaped valley where cold-air drainage produces a natural frost pocket -- frost has been recorded there in July and August. But these two factors alone wouldn't have prevented the hardwoods from taking over.

Professor Kennedy, who was the first visiting professor to teach at TABS, and his group found a mountain earth snake (Virginia valeriae pulchra), the second recorded mountain earth snake found in West Virginia (the first was found in 1966).

This mountain earth snake (Virginia valeriae pulchra) is only the second specimen of the sub-species found in West Virginia. It was discovered by the herpetology class working at West Virginia University's Terra Alta Biological Station this summer.

The other factor at Cranesville is the boggy conditions, which are unfavorable to hardwoods. The swamp developed as Muddy Creek, the main drainage stream in the area, cut downward to a layer of rock that slowed down the normal rate of erosion. The rock, which is called Pottsville Conglomerate, thus formed a natural dam and prevented good drainage.

Muddy Creek gets back to normal a few miles from the swamp when it falls about 60 feet. Unfortunately, many visitors to the area are unaware of Muddy Creek Falls and spend their time looking at Swallow Falls which are only 40 feet high.

The swamp is about eight miles north of TABS and straddles the West Virginia-Maryland line. It covers about 550 acres and from an economic standpoint it's virtually worthless. But as a sample of wild land, it's priceless -- nature isn't making any new ones.

The Nature Conservancy, a non-profit educational and scientific group, took the first step to preserve the swamp when it purchased 259 acres in 1960. This part of the swamp is administered by the WVU Arboretum under an agreement that specifies that the area will be maintained in its natural condition. Since 1960, about 16 additional acres were purchased by the Nature Conservancy and plans are under way to acquire the remaining acreage and preserve the entire swamp. The area was designated a natural history landmark by the U. S. Department of the Interior in 1965.

Eastern larch (tamarack) is the outstanding species of trees stranded in the swamp. Unlike most conifers, the larch sheds its needles in autumn. The needles are blue-green in the summer, but before they fall they turn a bright golden yellow. This is very unusual among conifers.

The large cranberry grows in the open, wet sections of the swamp. This is the same species that is sold in stores and according to one report they are sweeter than the cultivated ones. Among the cranberries a careful observer can find round-leaved sundew, a little plant that digests bugs caught on its sticky leaves.

Animals as well as plants reflect the harsh northern climate of the swamp. One of the most interesting is the northern water shrew, a small mouse-like mammal about two inches long and weighing about as much as a penny. Shrews are distinguished from mice by their long pointed snouts and pointed orange teeth.

With the aid of stiff bristles on the toes of its hind feet and its tremendous speed, the water shrew is able to run considerable distances over the water.

This ability seems to aid them in satisfying their voracious appetite. It is reported that a hungry shrew can eat the equivalent of its own weight every three hours. If a food shortage appears, they will devour their own kind and attack other animals many times their own size. Cranesville Swamp and the Williams River in Pocahontas County are the two most southern locations for this species in the East.

According to Dr. Bradshaw, shrews are the most abundant mammal in the state. But they are chiefly nocturnal and so secretive that they are seldom seen except by someone specifically looking for them. There are six species of them in West Virginia, the most common of which is the short-tail shrew. There is no record of any of them ever being tamed.

Visitors are welcome at the Cranesville Sanctuary, but they should remember to leave the bugs and the flowers and the cranberries for the water shrews, they might get hungry.

Another example of a living laboratory is situated a few miles from WVU's Biological Station. From the road it looks like an excellent place to throw beer bottles -- there is evidence that some citizens think this. A few yards inside it turns into a magnificent rock garden.

The garden is a two-acre exposure of Pocono Sandstone partly covered with stunted, undernourished plants and trees. Most gardeners would reject every species there, but mother nature has work for all of them.

Sometime in the past -- because of an ancient act of nature, fires, man's poor farming and forestry practices or a combination of the three -- the area was swept clean of trees, plants and soil. Now, through a process known as bare-rock sucession, the area is slowly becoming an oak forest.

First, lichens grow on the bare rocks; they hold a little moisture and soon, various forms of moss start to grow at the same spot. The lichen-moss community not only retains moisture but soil that is carried by the wind or washed down from above. Once there is moisture and soil, other plants -- such as poverty grass, huckleberry and blueberry -- live and die there. This builds up the top soil and enables larger plants and trees to grow.

The first tree to grow in the area is pitch pine, but because conditions are so severe, they are stunted and often uprooted by the wind and weather. Some survive and each generation is a little stronger. Finally, there is enough top soil for oaks to grow. The oaks grow and provide shade -- for the little oaks -- but the little pines and the little huckleberries die for want of the sun. They are caught between the rock and a shady place -- but all they have to do is wait for the lichen to grow and gather a little moisture and . . . . .

In places like this a student can see in 30 minutes what teachers and books could never convey.

Doyle Blauch, a graduate student from Ohio, is writing a research paper on the area and steps are being taken to preserve this remarkable habitat for future studies and enjoyment by nature lovers as an adjunct to the West Virginia University arboretum system.

William Aston, News Service, Morgantown, West Virginia 26506.

BOOK REVIEW

The Preservation of Natural History Specimens. Volume 2. Vertebrates, Botany, and Geology. Edited by Reginald Wagstaffe and J. Havelock Fidler. 1968. xv + 404 p. with 150 text figures. Available from: Philosophical Library, Inc., 15 East 40th Street, New York, New York 10016, for $17.50.

The editors of this second volume (the first was issued in 1955 and dealt exclusively with invertebrates) on the methods of preserving natural history specimens have produced a basic, concise assemblage of techniques currently used in most museums or institutions housing preserved collections of plants and animals, both fossil and recent. For the purpose of this review, however, I will restrict my discussion to those parts of the book that have application to herpetology.

The herpetological portion of this volume is contained in three short chapters which cover, respectively, preservation of amphibians, preservation of reptiles, and the Walter Plastic Method for reproduction of reptiles and amphibians (the latter chapter written by Ronald J. Lambert). These three chapters cover only nineteen pages. In addition, there is a brief paragraph (Appendix VIII B) by Francis Wheeler on poisonous snake bite. Chapter 5, dealing chiefly with preservation of amphibians in liquid, is presented in three parts according to the developmental stage of the specimen (i.e. adult, ova and embryo, or larvae). The latter two stages are also briefly discussed in terms of microscopic preparation. The turtles, lizards, snakes, and crocodilians are similarly discussed in Chapter 6 with the exception that methods for both wet and dry preservation are presented. Also, the chapter on reptiles gives some information on curing skins of very large specimens. Chapter 7 deals with the Walter Plastic Method for reproducing life-like casts of reptiles and amphibians for use in exhibitions. Although well-written and organized by Mr. Lambert, this section would have generated more appeal if drawings and diagrams had been utilized to better illustrate some of the procedures. The extremely short section by Francis Wheeler on poisonous snake bite is perplexing. It has little to do with the objective of the book as it is titled, and its inclusion as a one-paragraph article cannot do justice to a very complicated subject.

In summary, this book will generally have limited appeal to herpetologists due to its brevity in their field of interest. Certain museum and university staff personnel, however, might find the volume useful for reference, particularly as to the procedures of the Walter Plastic Method. Also, students will be more easily instructed in methods of preserving their specimens for classroom use by reference to this book. Ultimately, however, the text will arouse little desire to own it due to its prohibitive price.

JOSEPH T. COLLINS, Museum of Natural History, University of Kansas, Lawrence 66044.

BOOK REVIEW

Amphibians of Malawi, by Margaret M. Stewart, State University of New York. 1967. x 163 p. 20 colored plates. 67 figures. Available from: State University of New York Press for $7.50.

Very reasonably priced, for with burgeoning populations and rising costs a book with such beautiful colored plates is a good investment, as any young herpetologist may point out to his demurring wife, citing Pitman's "Snakes of Uganda" which, costing only $1.10 in 1938, is now priced at $75.

In addition to her excellently reproduced colored photographs, drawings - frequently supplemented by sketches of important details and tadpoles - have been made by the gifted authoress of every one of the sixty species or races occurring in the country. Nine of this number were added as a result of the year Dr. Stewart spent in Malawi. Indeed this is a remarkable, almost unique, book commencing with its dedication "To the Children of Malawi." Anyone familiar with the country will have no difficulty in visualising the author's bright-eyed collaborators as they eagerly crowd about her with their captured frogs - commonplace creatures that have suddenly a cash value.

What impresses the present reviewer is the meticulous attention to detail displayed throughout an eminently readable book whose primary objective was "to provide a means of identification for the novice, the layman, or the student," with the modestly expressed hope that it "may also be of service to herpetologists." In both spheres the author is successful, substituting the customary jargon of the taxonomist for a pleasing versatility of expression such as "spindly legs" and "stubby fingers," adjectives that precisely describe the limbs and digits of the toad under discussion.

Amphibia, accompanied by outline drawings of a frog clearly named, are defined as "vertebrate animals with smooth skins," a definition that would appear to exclude many bufonids! Then follow sections dealing with everything pertaining to these creatures - their care in captivity, tape-recording their distinctive calls, etc. etc. Under 'collecting' we learn that the author used an ordinary landing net within a nylon bag, which seems a good idea. There is also a timely warning of the risks of contracting bilharzia when frogging in lowland Africa. If the captures are to be killed, immersion in 1% solution of chlorotone is recommended. This is certainly more humane than the alternative of a 1% solution of formalin. In view of an 8% solution of the same fluid being listed under 'preserving'; formalin's corrosive effects on metal - with subsequent damage to the specimens - should have been mentioned when stating that "plastic or metal tags provide the most permanent labels." Doubtless written when the author had only 70% ethyl alcohol in mind.

Following the Systematic Index is an originally devised key based on readily observed differences, so not necessarily corresponding to the systematic order. Time alone, and testing with different material, will reveal how well its purpose is achieved.

Dr. Stewart has examined the Malawi material in many museums, submitting specimens of questionable status to Dr. J. C. Poynton for a second opinion. With some minor adjustments she follows the nomenclature of Poynton's 1964 volume on "The Amphibia of Southern Africa," and his 1964 article on the "Amphibia of the Nyasa-Luangwa region of Africa," where certain groups (Rhacophoridae, Hyperoliidae, etc) are sensibly treated as subfamilies of the Ranidae - a world-wide revision of which is long overdue. When one comes to the admittedly unwieldy genus Rana, however, the same conservative attitude is discarded and in line with the current fashion subgenera are raised to generic status. While this may work well for African members an impression remains that it will break down when one has to deal with Asiatic species. Dr. Stewart's excellent drawings of the ten Malawi members of the confusing Ptychadena group should assist future workers to avoid the mistakes I have made.

Following the scientific and English name of each frog, Dr. Stewart provides about a dozen subheadings in such clear type as will enable the busy searcher for information to find at a glance what is available, be it VARIATION, SEXUAL DIMORPHISM, CALL, EGGS AND DEVELOPMENT, HABITS, etc., embodying a wealth of information, much of it based on her own observations. Under RECORDS Dr. Stewart lists all reliable localities while, in view of systematic collecting in Malawi being in its infancy, wisely refraining from including range maps. Under RANGE I note she has rather neatly and briefly overcome one of the recent political changes by substituting "Tanzania mainland" for Tanganyika Territory prior to its amalgamation with Zanzibar.

Residents of Malawi (formerly Nyasaland) are indeed fortunate to be provided with so reliable and readable a book, and it is permissable to hope that "The Children of Malawi" - to whom it is dedicated - may grow up in peach under the wise and pragmatic leadership of President H. K. Banda, to whose cooperation Dr. M. M. Stewart pays tribute.

ARTHUR LOVERIDGE, Varneys, Island of St. Helena, South Atlantic Ocean.

BOOK REVIEW

Living Turtles of the World, by Peter C. H. Pritchard. 288 pages. T. F. H. Publications, Inc., 1967. $9.95.

Of all the reptiles, turtles probably have the largest number of lay supporters, but surprisingly there have been no general books to cater to the interest of this audience. Mr. Pritchard's book is the first such attempt. Unlike the handbooks of Pope and Carr, his goal has been to describe all the extant species of turtles and to provide a source of general information on chelonian biology. I believe that he has successfully accomplished the former part of his goal but is much less successful for the latter part.

The bulk of "Living Turtles of the World" is devoted to the descriptions of turtle species and subspecies; essentially eight chapters and over 200 pages are involved in this task. To my amazement, these chapters are highly readable, for normally when so much space is dedicated to characterizations of species, one is lulled into sound sleep. The author is to be congratulated on his skilled manipulations of the characterizations. These descriptions should enable a reader to determine the specific identity of a turtle if he is aware of its generic allocation, for in most cases, there is insufficient information on generic determination; however, this shortcoming is readily overcome by referring to the many photographs. The book is crammed with black-and-white and color photographs which illustrate the majority of extant turtles. The quality of the photographs is usually excellent; this is especially true of the black-and-white ones. The color photographs are also very good; however, in some cases it appears that the shells were moistened before photographing to enhance the colors and patterns but instead the moisture produced large areas of glare on the shells. The placement of the color photographs usually does not correspond to the text so one is forced to leaf back and forth to discover the appropriate plate. In addition, the color illustrations of Batagur baska, Geochelone emys, and Orlitia borneensis are comical rather than helpful.

Mr. Pritchard has been less successful in his attempt to supply general information on turtles. Much of the space devoted to "general information" is concerned with nomenclatural matters and/or differentiation of races rather than to chelonian biology. For example, two-thirds of the chapter on turtle families is an historical resumé of familial classification, the tortoise section has half of the space devoted to the discovery and description of giant tortoises, and several pages of the soft-shell turtle section are devoted to the Amyda-Trionyx feud. I do not wish to imply that the above are poorly handled but rather that the space could have been more profitably used to discuss what little ecological data we have on these groups.

Unfortunately I feel that the author is frequently guilty of perpetuating misinformation or causing confusion. I believe some of the following examples will support my contention. Although there have been two relatively recent attempts to stabilize the terminology of carapacial scutes, Pritchard presents Stejneger's scheme which is sufficiently different to cause confusion anew. His statements on familial relationships are inconsistent. Even though he cites Carettochelys as a cryptodire, he evidently believes it is a pleurodire by his discussion and its origin on the cladogram from Chelidae. Dermatemys is stated as a close relative of kinosternids yet dermatemydids gave rise to emydids, and kinosternids and chelydrids arose from testudinids. Likewise his nomenclature is inconsistent; he uses one nomenclature in the text and a similar, yet distinct one, in the appendix, i.e., Emys, Emydoidea; Macrochelys, Macroclemys; P. floridana concinna, P. concinna concinna. If he didn't wish to use Sternothaerus for the musk turtles, he could have avoided confusion by likewise not mentioning it in conjunction with the sideneck Pelusios. Some of his explanations are misleading or inaccurate, i.e. "sea turtles lay the most [eggs], since these turtles are exposed to many dangers during their early existence", "[Carettochelys] is distinguished from soft-shells proper by presence of peripheral bones," or "the body was practically twisted inside-out, so that the limb girdles eventuated inside the ribs; thus was the turtle formed."

Not all is as bad as the last two paragraphs imply. The chapter on the evolution of turtles is a good introduction to the subject. There are two interesting, but unfortunately, short chapters on chelonian reproductive habits, and an entire chapter on turtle care in captivity.

In spite of my many complaints against the lack of and the inaccuracy of some of the material on chelonian biology, I wish to recommend "Living Turtles of the World" to all those who have a thing for turtles, and especially to those wanting a ready reference for identification and suggestions on care of captive specimens.

SOCIETY'S DUES ARE INCREASED FOR 1969

At the Society's eleventh annual meeting the Board of Directors voted to increase dues for calendar 1969 as follow: Regular member (U.S. and Canada) - $6.00; Foreign member - $5.00; Sustaining member - $8.00; and institutional subscription - $10.00. Contributing membership and Life membership remain the same at, respectively, $15.00 and $100.00.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles. Regular dues are $4.00 worldwide and should be remitted (preferably via international money order outside the U. S. A. and Canada) to the Secretary-Treasurer. Members are invited to subscribe to the higher categories of Sustaining ($5.00), Contributing ($15.00), or Life ($100, in four payments of $25.00) membership. Institutional subscription is $6.00. A complete list of publications of The Ohio Herpetological Society and the Society for the Study of Amphibians and Reptiles is available from the Publications Secretary.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor.

PROPOSED SYMPOSIUM FOR AAAS MEETING

Under the direction of Victor H. Hutchison, Institute of Environmental Biology, University of Rhode Island, Kingston 02881, a symposium on physiological ecology of amphibians has been proposed for the AAAS meeting in Dallas, Texas, from 29-30 December 1968.

The symposium will have the general purpose of bringing together current work on physiological responses of amphibians to environmental changes. The amphibians, occupying the vertebrate evolutionary position of transition from aquatic to terrestrial existence, offer one of the most fruitful animal groups for study and eventual understanding of the evolution of physiological systems in diverse environments. A recent increase in interest in this field, as evidenced by the increasing number of investigators and publications suggests that this proposed symposium is both timely and appropriate.

First Session (29 December)

Chairman: Bernard S. Martof
- Francis L. Rose - Ecological Aspects of Glycogen and Lipid Utilization in Amphibians.
- Thomas B. Thorson - Partitioning of Body Water in Amphibians.
- James A. MacMahon - Water Relations in Amphibians.

Second Session (29 December)

Chairman: Walter G. Whitford
- Rodolfo Ruibal - Utilization of Soil Moisture by Amphibians.
- Vaughn H. Shoemaker - Physiological Effects of Dehydration.
- Bayard H. Brattstrom - Temperature Relations in Amphibians.

Third Session (30 December)

Chairman: Harold A. Dundee
- W. Frank Blair - Adaptation to Diverse Environments in Anurans.
- Victor H. Hutchison - Gas Exchange in Amphibians.
- Stanley Salthe - Molecular Aspects of Physiological Adaptation in Amphibians.

The above-listed papers should have a wide interest, especially to ecologists, comparative physiologists, and vertebrate zoologists. The symposium will be sponsored by the Ecological Society of America.

***

A PLEA TO SAVE SHELTA CAVE IN ALABAMA

The National Speleological Society, acting through the timely agency of the Nature Conservancy, has recently moved to preserve access to one of the world's truly unique underground ecosystems. A remarkable assemblage of animals lives in the groundwaters beneath the bustling streets of Huntsville, Alabama, and Shelta Cave, whose adjacent entrances lie on a vacant lot just off the Pulaski Pike in this city, provides access to this unusual community. This lot recently came up for sale through an estate, and potential purchasers wanted to permanently seal the cave entrances to facilitate commercial development. In addition to cutting off access to this ecosystem for biologists, this action would have eliminated the colony of bats which inhabit the cave and probably drastically altered the ecological relationships to the detriment of the unique community. Thus, Shelta Cave became another in the unfortunately long list of examples of invaluable natural areas threatened by urbanization. Preservation of this cave is of utmost importance, and has been undertaken.

Shelta Cave's major claims to distinction lie in the remarkable diversity of its troglobitic (cave-adapted) animals and the fact that it is the type locality for nine species of cave animals, two of them apparent endemics. It will also be the type locality for other forms not yet described. It probably contains more kinds of major aquatic troglobites than any known cave in the world, and its terrestrial fauna is also quite rich. Thus, it offers for study an ecosystem in which the environmental parameters are reduced and yet where the maximum community complexity attainable in such a deprived environment may well be represented. In addition to its potential as a natural ecological "laboratory" and its value as a multiple type locality, the cave is also a marvelous nature preserve. It is one of but a few caves known to house three distinct species of troglobitic crayfishes, one of them an as-yet undescribed endemic, and is the type locality for one of the others. It also harbors a population of the endemic cave shrimp, Palaemonias alabamae, one of only two known troglobitic atyids. Other aquatic troglobites in Shelta include the fish Typhlichthys subterraneus, the salamander Gyrinophilus palleucus, an undescribed flatworm, and an undescribed amphipod. In addition to its aquatic fauna, Shelta contains at least nine species of terrestrial troglobites -- three cave beetles, a snail, a pseudoscorpion, a millipede, a spider, a dipluran, and an undescribed thysanuran. It is the type locality of six of these animals, as well as of the non-troglobitic isopod, Miktoniscus alabamensis. In all, counting non-troglobites but not microscopic forms or para sites, the cave houses populations of over forty species of animals.

In addition to research programs, educational tours involving the local community and various school groups are envisioned as part of the program for use of the cave. The Huntsville Chapter of the National Speleological Society will serve as custodian of the cave and administer it according to policies established by the Society's Research Advisory Committee and Nature Conservancy.

Further information on the Project may be obtained from John E. Cooper, Department of Zoology and Institute of Speleology, University of Kentucky, Lexington, Kentucky 40506.

The National Speleological Society needs the help of all biologists, conservationists and other concerned persons in its campaign to Save Shelta Cave. Its immediate goal is to raise $10,000. Tax-deductible contributions may be sent to:

"N. S. S. Shelta Cave Project", 2318 N. Kenmore Street, Arlington, Virginia 22201.

UNIVERSITY OF MICHIGAN AMPHIBIAN FACILITY

The University of Michigan's Amphibian Facility at Ann Arbor was developed by Dr. George W. Nace and is now organized as a joint project of the Department of Zoology and the Center for Human Growth and Development. The original impetus for developing the facility was Dr. Nace's need for amphibians of defined nutritional, health, and genetic background. These amphibians were used for molecular studies of embryonic and tumor development. A second objective is to produce these animals for others in the scientific community. This includes the development of practical procedures for maintaining large laboratory colonies of these animals. Colonies of both anuran and urodele species are under development, although to date the major emphasis has been on Rana pipiens.

Major support for the Amphibian Facility comes from a domestic NSF grant and from the Damon Runyon Memorial Foundation. Additional support comes from a U. S. -Japan Cooperative Science Program grant organized in cooperation with President T. Kawamura of the University of Hiroshima who also has an amphibian facility. His objectives are primarily concerned with ranid speciation and development.

"Inbred" strains of amphibians are produced by use of gynogenetic techniques. Currently the second generation of animals developed in the laboratory is approaching metamorphosis. These have been developed since the present space in the Argus Building in Ann Arbor was occupied in 1966.

BOOK REVIEW

The Life and Demography of the Side-Blotched Lizard, Uta stansburiana, Misc. Publ. Mus. Zool. Univ. Mich., No. 135, 182 p. by Donald W. Tinkle, Museum of Zoology, University of Michigan, Ann Arbor, Michigan, U. S. A. Available from the Museum of Zoology, Univ. Mich. at $3.75 paperbound or $4.75 cloth.

Most studies on reptilian populations are either of relatively short duration or cover only a few aspects and as such have limited comparative value. Dr. Tinkle's study lasted 9 years (6 years intensively) and in addition to detailed treatment of demography, growth, reproductive cycle and home range and territory, also included somewhat more general studies of feeding habits, predators, shedding, regeneration, courtship behavior, thermal ecology and temperature tolerances, radiation effects and homing ability. Few investigations in this field have achieved such a high degree of comprehensiveness and thoroughness. That is not to say that no gaps are present or that all aspects were covered as completely as might be desired. Indeed, the author has indicated in various places where more data are needed, where additional studies are desirable for a complete understanding of even this one species, and where his information admits of alternative interpretations. This in itself is a contribution in that it should stimulate further investigation.

One of the unique features of this study is the emphasis on comparative demography, and the example provided by a comparison of Texas and Colorado populations of Uta stansburiana. As the author points out, data adequate for making comparisons of the sort contributing to an understanding of either the evolution of demographic properties or how they are influenced by environmental factors are painfully few. In some cases useful data were obtained from only 10-20 published reports. The author's appeal that clutch size, growth, movements, and longevity should be studied on a population basis rather than by recourse to records on a few individuals, his suggestion that experimental approaches (in both field and laboratory) toward study of lizard populations, and his enumeration of specific problems arising from the study of Uta, should all pave the way toward more meaningful research in this area.

In addition to contributing original data this paper reviews the literature on many of the topics covered by his study. Though some aspects are more comprehensively reviewed than others, all are critically treated. Selection of papers with data of comparative value was made rather than attempting to discuss all publications in a particular field.

Harold Heatwole, Department of Zoology, University of New England, Armidale, N. S. W., Australia.

DORIS MABLE COCHRAN

Doris M. Cochran, 70, died May 22 after a long illness. Born May 18, 1898 at North Girard, Pennsylvania, she began her 50-year career with the Smithsonian Institution as a museum aide in 1919. In 1920 she earned her A. B., and in 1921 her M. S., both at George Washington University. In 1927 she was appointed assistant curator of reptiles and amphibians at the U. S. National Museum. Following this appointment, Dr. Cochran received an M. A. from John Hopkins University in 1928, and was awarded her Ph. D. from the University of Maryland in 1933. In 1942 she was elevated to the rank of associate curator at the U. S. N. M., and from 1956 to 1966 she served as Curator-In-Charge of the U. S. National Museum's division of reptiles and amphibians.

Dr. Cochran's research work centered on South American frogs, though her interests ranged from the myology of the crustaceans to the taxonomy of the reptiles and amphibians of the West Indies, Siam, and the East Indies. Additionally, she was a talented weaver. In 1946 she served with the Atomic Energy Commission. She was honored in 1953 when the Herpetologist's League dedicated an issue of its publication to her, and in 1962 she was named Distinguished Fellow of the American Society of Ichthyologists and Herpetologists. Dr. Cochran published numerous articles, many of which she personally illustrated. Her most popular book, Living Amphibians of the World, has been translated into nine languages. — Ed.

MEMBERS DESIDERATA

Mary L. Anderson, 2236 Denniston Avenue, Roanoke, Virginia, wishes correspondence with others regarding cruelty to turtles sold in commercial establishments.

Sylvester E. Dietrich, Hidden Ridge Lab., Route 2, Box 142, New Haven, Missouri wishes addresses of foreign herpetological organizations. Also interested in books on anatomy and diseases of snakes.

Current Herpetological Titles, III: 1968

By H. G. Dowling, Itzchak Gilboa, and Irene Palser

GENERA OF REPTILES, American Museum of Natural History, New York, New York 10024.

****

THIS THIRD LIST OF CURRENT HERPETOLOGICAL TITLES (SEE HERPETOLOGICAL REVIEW NUMBERS 2 AND 3 FOR PREVIOUS LISTS) INCLUDES ALL TITLES PUBLISHED IN 1968 THAT HAVE COME TO OUR ATTENTION DURING THE PERIOD 16 MAY TO 5 AUGUST. A FEW TITLES HAVE BEEN OBTAINED FROM SECONDARY SOURCES, BUT THESE MAKE UP LESS THAN 5 PER CENT OF THE TITLES LISTED. LIKE THE PREVIOUS LISTS, THIS ONE IS PHOTO-OFFSET REPRODUCTION FROM COMPUTER PRINTOUT.

FUTURE: TO THIS DATE THE CURRENT LIST OF TITLES HAS BEEN NO MORE THAN THAT. HOWEVER, WE HAVE BEGUN TO CROSS-INDEX THE 1968 LITERATURE FOR ACCESS THROUGH TAXONOMIC, GEOGRAPHIC, AND SUBJECT AVENUES. WE DO NOT ANTICIPATE PUBLISHING THIS INDEX BUT INSTEAD ARE ATTEMPTING TO COORDINATE OUR EFFORTS WITH BIOLOGICAL ABSTRACTS AND ZOOLOGICAL RECORD.

ONE POINT THAT HAS NOT BEEN EMPHASIZED TO DATE IS THAT THE VAST MAJORITY OF LISTED PAPERS IS IMMEDIATELY AVAILABLE TO US. WE ARE BASED AT ONE OF THE GREATEST (AND LIKELY THE MOST ACCESSIBLE) HERPETOLOGICAL LIBRARIES OF THE WORLD. WE DO NOT ANTICIPATE BEING READY TO ACT AS A BIBLIOGRAPHIC SERVICE FOR ANOTHER YEAR. HOWEVER, IF YOU ARE REALLY STUCK FOR A REFERENCE, LET US KNOW: WE WILL SEE WHAT WE CAN DO.

ACKNOWLEDGMENTS: THIS LIST WAS PREPARED WITH THE AID OF THE HERPETOLOGY DEPARTMENT AND THE LIBRARY OF THE MUSEUM, AND THE DEPARTMENT OF ZOOLOGY AND THE COMPUTER LABORATORY OF THE UNIVERSITY OF RHODE ISLAND. WE ARE ESPECIALLY GRATEFUL FOR THE HELP OF MR. JAMES BRADLEY OF THE COMPUTER LABORATORY. THE PROJECT IS SUPPORTED BY THE NATIONAL SCIENCE FOUNDATION (NSF GN-707).

ON USING THE LIST: THE LIST IS ARRANGED, AS IS CUSTOMARY, ALPHABETICALLY BY SENIOR AUTHOR, FOLLOWED BY THE DATE, TITLE, AND JOURNAL REFERENCE. IN ADDITION, THE NAMES OF JUNIOR AUTHORS ARE REFERRED TO THE PROPER CITATIONS BY "SEE" LINES THAT ARE IN THE FORM OF A CODE. NOTE, FOR EXAMPLE, THE REFERENCE UNDER "AB'SABER,AZIZ N." THAT SAYS, (SEE VANPE-968DRS: 205). THE "VANPE" REFERS TO A PAPER BY VANZOLINI,P.E. AND AB'SABER (THE CODE IS DERIVED FROM THE FIRST THREE LETTERS OF THE SENIOR AUTHOR'S FAMILY NAME AND THE INITIAL LETTERS OF HIS (FIRST TWO) GIVEN NAMES). THE "968" IS THE YEAR OF PUBLICATION, MINUS THE INITIAL "1", AND THE FOLLOWING "DRS" IS DERIVED FROM THE INITIAL LETTERS OF THE FIRST THREE SIGNIFICANT WORDS OF THE TITLE (OR SUBTITLE IF THE PAPER IS ONE OF A SERIES). THE NUMBER "205" AFTER THE COLON IS THE INITIAL PAGE NUMBER OF THE ARTICLE. THUS, THOUGH THE CODE DOES NOT FOLLOW STRICT ALPHABETICAL ORDER, IT IS VERY SPECIFIC.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles. Regular dues are $4.00 worldwide and should be remitted (preferably via international money order outside the U. S. A. and Canada) to the Secretary-Treasurer. Members are invited to subscribe to the higher categories of Sustaining ($5.00), Contributing ($15.00), or Life ($100, in four payments of $25.00) membership. Institutional subscription is $6.00. A complete list of publications of The Ohio Herpetological Society and the Society for the Study of Amphibians and Reptiles is available from the Publications Secretary.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor. (address at top left)

SSAR meeting

SSAR MEETING NEXT MONTH.

The Society will hold its eleventh annual meeting next month (23-25 August) at Mountain Lake Biological Station, located in western Virginia near Blacksburg; details and photos may be found in Herpetological Review no. 2, p. 5.

A REGISTRATION BLANK IS ENCLOSED IN THIS MAILING. This is to be returned to Dr. James A. Organ, Mountain Lake Biological Station, Route 1, Pembroke, Virginia 24136. Registration will be limited by the size of the Station's auditorium which seats 100, so be sure to register early if you plan to attend. The definitive program will be mailed about August 1st. Camping facilities are available nearby and details may be obtained by writing Dr. Organ.

.....CALL FOR PAPERS.....

A number of paper titles have already been submitted. In addition, the Society has invited two leading specialists to present lectures on Saturday, 24 August. These persons are Dr. Carl Gans (Department of Biology, State University of New York at Buffalo) and Dr. Richard Highton (Department of Zoology, University of Maryland); titles will be announced in the official program.

IF YOU WISH TO GIVE A PAPER, fill in the enclosed form and return it to Dr. Organ at once; titles received after July 20th cannot be listed in the program. Be sure to indicate needed projection equipment. Papers may not be presented by title only.

Those persons who wish to submit photos for the display are asked to send them at once to Kraig Adler, Museum of Zoology, The University of Michigan, Ann Arbor, Michigan 48104. Black-and-white or color enlargements of any species are acceptable; be sure to list species and locality. Photos will be returned immediately after the meeting.

●

SYMPOSIUM ON AMPHIBIAN TUMORS.

A three-day symposium on amphibian tumors will be held at the Royal Orleans Hotel in New Orleans, Louisiana, starting Monday, 28 October. If you wish to attend, please register with Dr. Merle Mizell, Department of Biology, Tulane University, New Orleans, Louisiana 70118. Topics to be covered include amphibian cells in vitro, immunity, viruses, lymphosarcoma, Lucké Renal Adenocarcinoma, and biologically defined strains of Amphibia. It is planned that the proceedings of this symposium will be published as a monograph of the Journal of the National Cancer Institute.

A NEW DESIGN FOR ZOO REPTILE HOUSES

THE COLUMBUS ZOO's NEW REPTILIA-AMPHIBIA HALL: A new approach to design

by Louis Pistoia, Curator of Reptiles and Amphibians, Columbus Zoological Gardens, Powell, Ohio.

★★★★★

IT IS quite surprising that zoo reptile houses continue to be designed and built along those old, conventional lines which stress work corridors and exhibit walls alongside the building periphery, accentuated by one or two display islands in the center of the building. Constant exposure to such structures sooner or later reveals the inherent faults in this archaic architectural plan. Reptilia-Amphibia Hall's basic and original scheme is a genuine attempt to correct obvious flaws and not just a frilled duplication of the conventional design. After many preliminary sketches and consultation with the architects, master-planners, engineers, contractors and landscapers the final plan was chosen.

BASIC DESIGN

Reptilia-Amphibia Hall is circular, 124 feet in diameter, with 16 sides, each tangent to the circle (Fig. 1.). Each wall is interrupted at the corners by rough-sawn cedar louvres the full height of the walls - there are functional as well as decorative and there are corresponding double-doors to the inside. During favorable weather these doors can be opened, the cupola fan turned on, and fresh air drawn into the visitors' area. The outside walls are stucco on concrete block (Fig. 2.) and the inside facing is of special mould lending a decorative pattern to the walls. The entire roof, including the cupola, is finished in black asphalt shingle over rigid insulation and a wood deck supported on laminated wood beams; the deck and beams constitute the finished ceiling in the peripheral corridors and central area - the three remaining corridors have low, flush, plastered ceilings. There is not a single window or skylight in the entire building. An eight-foot concrete walk encircling the building is protected by the roof's overhang. The two entrances are 45 degrees apart, each with four glass-framed doors and a column of native stone running down the middle. Both entrances are encompassed by a wide and walled (native stone) veranda overlooking a large, asphalt-bottomed pool; the pool has a riprap of limestone rocks and boulders. Wide steps lead up to the entrances while in the back a ramp extends to a double-door emergency exit.

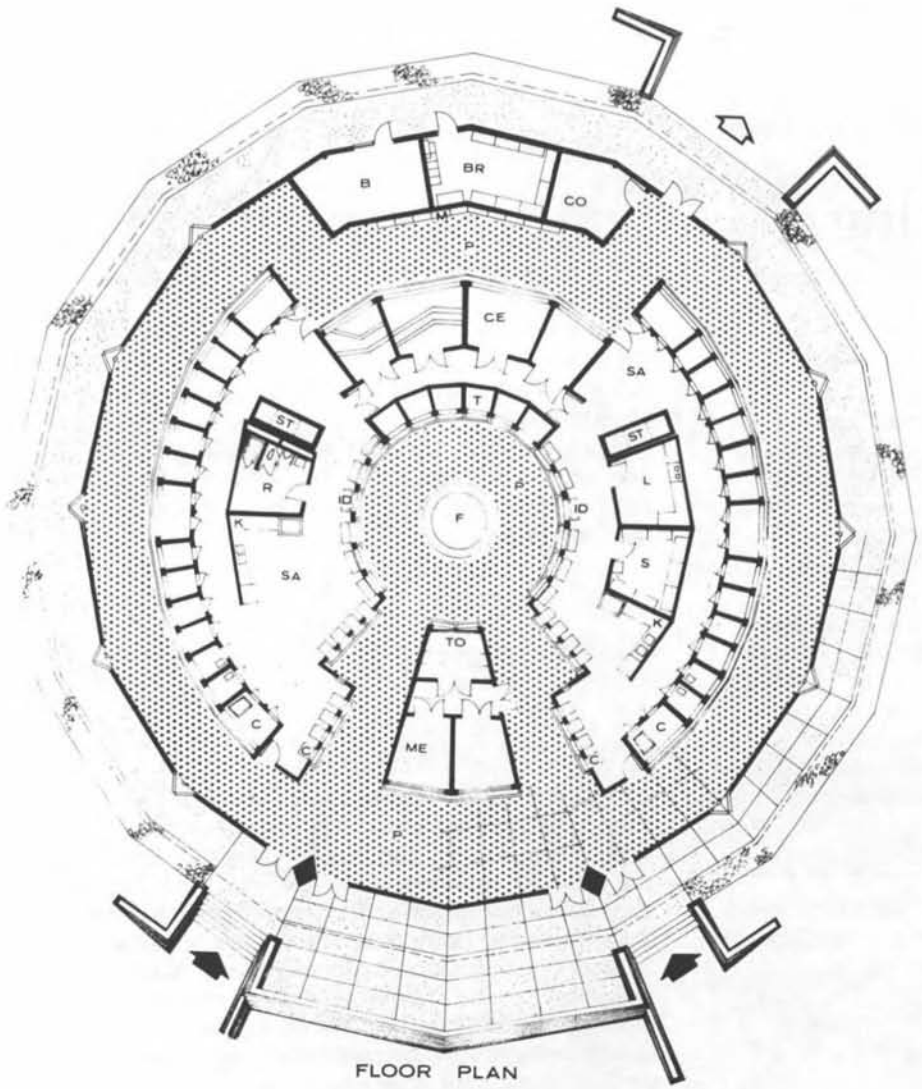

FIGURE 1. Floor plan of Reptilia-Amphibia Hall. Stippling shows public areas (P); arrows show entrances and emergency exit. Legend: C, cages; CE, crocodilian enclosures; ID, interchangeable displays; ME, marine exhibits; TO, tortoises; B, boiler room; BR, breeding room; CO, curator's office; F, fountain; K, kitchen; L, laboratory; M, museum cases; R, restroom; S, surplus; SA, service area; ST, surplus tanks; T, tanks.

If those familiar with the old conventional design of reptile houses will glance at the floor plan of Reptilia-Amphibia Hall they will notice that the major change from that design has been the complete interchange of display and public areas. The new design offers two display corridors on either side of a frontal display island. These are accessible to a core area complete with a central fountain twelve feet in diameter. An overall effect of a keyhole surrounded by displays has been adapted and serves well to avoid the monotony of having the viewing area solely around the periphery. The advantages of this fresh approach are numerous. One of the main differences is an immediate introduction to a continuous one-sided display, eliminating the viewer's need to bounce from one display wall to another, such as an island wall. Removing this back and forth movement definitely improves traffic flow, although I personally feel that there is no permanent solution to this problem when dealing with large crowds; and nothing is worse than having to wait in line to see something. However, here it is possible for one to choose any of four directions, easily pass a congested spot without bumping into traffic along an opposite wall, and continue to view the exhibits.

In the old-type reptile house all visitors are contained within the ring of heated displays with resulting discomfort. But in this new Hall, because of the adopted interchange of public and exhibit areas, the majority of the viewers will be to the outside of the displays, where it is cooler and the air is fresher. It was customary, in the old plan, to leave the crocodilian enclosure exposed (without glass). This resulted in the escape of needed heat from the enclosures into the public area, where it became excessive for human comfort. In Reptilia-Amphibia Hall all displays, including the crocodilian enclosures, are behind glass, thus confining the needed heat and at the same time eliminating the problem of wanton visitors throwing refuse or spitting at the animals.

FIGURE 2. Front view of Reptilia-Amphibia Hall.

The most important single innovation of the new Hall, however, is the aesthetic impact of its plan upon the visitor. As a person enters the Hall he is confronted with a massive exhibit, but he receives only a glimpse of the whole -- the rest is left to his imagination and eventual exploration. His excitement may run keen as he peers through the core corridor and sees the fountain with its spray of water (Fig. 3.). He is also aware that beyond the island exhibit there is a central display room, other than the corridor displays and the wall of large peripheral cages. Only a portion of these peripheral cages is visible to him because the wall curves away from his line of vision. And later, when he makes the turn around the far corner of this curved wall, he is suddenly confronted with crocodilian enclosures fifty feet in total length. Surely this continuing discovery of displays lends to the Hall's potential as an exciting experience - and a right step in the art of display.

In contrast, consider the old approach. In most cases, merely standing inside the entrance the visitor sees almost the entire exhibit and all that is left for him is the inspection of the individual units. Since he has already noticed these sections, there results both a loss of impact and display value.

SERVICE AREAS

The two main service areas are enclosed by the displays and connected to each other by a service corridor, the latter to service both the crocodilian enclosures and the aquatic tanks opposite them. Within one service area is a laboratory, a surplus room, an L-shaped kitchen with formica counters, base and wall cabinets, double-basin stainless steel sink (with waste disposal), plus a large stainless steel sink (with booster heater) and refrigerator. The opposite area repeats the kitchen (with freezer) and large sink plus a complete rest room. Each service area also has a long concrete tank, with removable partitions, for surplus crocodilians, turtles, etc.

DISPLAYS

The two peripheral display walls, with their large cages of two sizes, are constructed of concrete block and cement plaster. The adjoining walls are of cement plaster over concrete block (unlike the thin walls prevalent in most reptile houses). All of these cages are individually drained (indirect draining) - the pools drained separately from the floors. Tempered water is piped not only to these pools, but also to the crocodilian pools, aquatic tanks, tortoise pool and marine displays. The cages are lighted by special fluorescent fixtures which contain heat ducts. Their use permits a smaller opening in the top of each cage, thus insuring that the heat reaches the floor of the cage (where the reptile is). There are also other light fixtures, permitting the use of sunlamps, heat lamps or special effect lamps. In addition, the larger cages have thermowire installed in the top to radiate extra heat when needed. The last three units, on the right side, are air-conditioned for any reptiles requiring lower temperatures -- they still can be used conventionally. All doors to these large units are dutched, as are the doors to the crocodilian enclosures. Instead of the usual key and lock, or padlock installation, which necessitates the use of both hands to open (this is a very bad safety feature), a single action cam lock is used, requiring the use of only one hand.

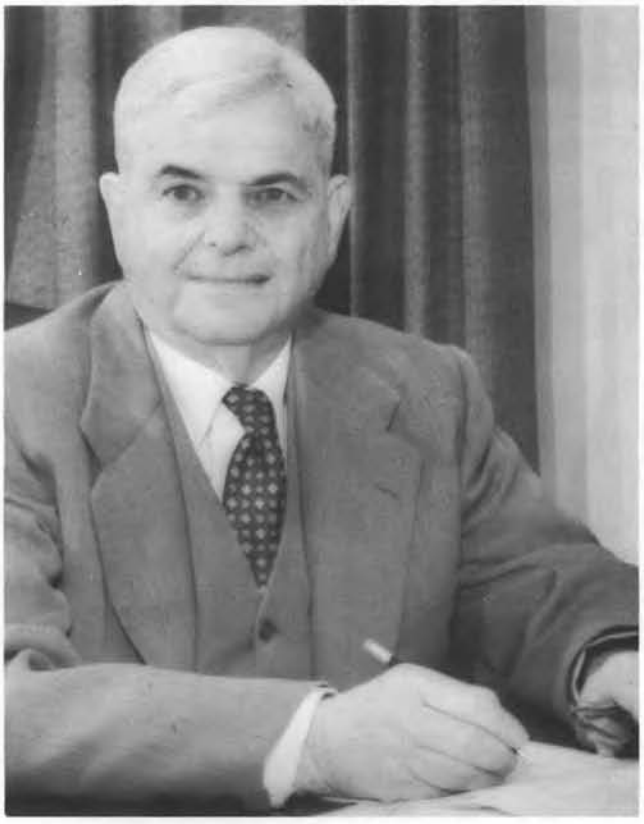
The six aquatic tanks are constructed of concrete, with laminated glass fronts. All are filtered and drained separately, the two end ones equipped with special salt-water filters. The marine (sea-turtle) displays are also filtered and drained separately. Unlike the aquatic tanks, where the specimens are viewed through the water, here the specimens are seen from above the water level. Special light fixtures have been installed to withstand the corrosive action of salt in the atmosphere -- the glass frames are also protected against this corrosion. Double doors lead to the marine displays as well as to the large tortoise enclosure, crocodilian enclosures and the two main service areas to accomodate the transfer of large specimens. The tortoise and crocodilian enclosures have both land and pool areas. The use of glass fronts for these displays not only stops anything from being thrown at the specimens but it also possibilitates for a closer viewing of specimens.

FIGURE 3. View through corridor showing tiered cages and central area. This is repeated on the opposite side of the display island. All photographs by Robert Kondik (Columbus Zoo).

The two corridor displays, on either side of the island displays, have a total of 32 tiered cages. These are constructed of mahogany plywood -- to show the mahogany finish as a background. They are free-moving behind deep formica frames. The sign openings are located in the frames between the tiers and on a separate plane from that of the cage fronts. Translucent signs are serviced from behind-the-scenes and illuminated by the lights to the lower tier of cages.

The core display is a showroom by itself. The wall above the displays is finished in rough cork. The dome of the building, with its wood deck and laminated beams, is exposed to view. Aside from the aquatic tanks and tortoise displays, already mentioned, the area contains interchangeable displays -- a total of twelve openings, with interchangeable panels and movable shelves and lights. Each accomodates varied sizes of displays. The design has flexibility in that it will enable a showing of from 12 to 48 displays, possibly more, according to the needs of the collection.

At the back of the building are the boiler room, breeding room (for rats and mice) and curator's office, the latter available to public business and not buried behind-the-scenes. The common wall to these areas, opposite the crocodilian enclosures, contains 30 feet of museum showcases. The mezzanine is located above this area with a floor area of 2500 square feet. Located here are the multi-zone heating and air-conditioning units, hot water storage tank, tempered water units, controls, and the two salt-water filters for the end aquatic tanks. A percentage of fresh air is continually brought in to the displays through supply plenums. Part of the mezzanine is the exhaust area, with two large fans, for removing the foul air from the building; this is exclusive of the cupola fan which exhausts the public area.



Though a number of details have not been discussed, it should be mentioned that the Hall is complete with alarm, intercom and telephone systems, plus a music and public address system.

Construction of Reptilia-Amphibia Hall started October 24, 1966, and public admittance started April 13, 1968. The project was financed by the City of Columbus, Ohio, and cost $428,000.00 exclusive of the architects' fees. It is the first new building in the Zoo's masterplan. We feel it is a good start.

[The Zoo's collection is equally as exciting as its new Hall. We anticipate a companion article on the collection for a future issue of the Review. - Ed.]

■■■

L. M. KLAUBER

Laurence Monroe Klauber, 84, died after a long illness on 8 May 1968 in San Diego, California. He was born there in 1883 and rose from salesman to president and chairman of the board of the San Diego Gas and Electric Co., retiring in 1953. He was educated at Stanford (A. B., 1908) and received an honorary degree from his alma mater's rival, the University of California, Los Angeles (LL. D., 1941). It was this last-named institution that published his monumental 2-volume "Rattlesnakes, their habits, life histories, and influence on mankind" in 1956; Dr. Klauber was working on a revision of this book at the time of his death. He will be remembered by herpetologists for his careful taxonomic studies on the reptiles of the Southwest and particularly for his application of statistical methods in herpetology.

He was long associated with the San Diego Natural History Society and the San Diego Zoological Society where he published most of his papers; his extensive library and collections will be deposited at the Museum. He served as president of the American Society of Ichthyologists and Herpetologists (1938-1940) and the Society of Systematic Zoology (1955), and had been a sustaining member of the Society for the Study of Amphibians and Reptiles since its founding in 1958.

SECOND HERPETOLOGICAL CONFERENCE OF THE U.S.S.R.

The second all-union herpetological conference was held in Leningrad 14-16 November 1966. Altogether 65 participants from 20 cities registered. The conference was opened with an introductory speech by Academician B. E. Bykhovskii.

P. V. Terent'ev (Leningrad) reported on the problems of Soviet herpetologists in connection with the International Biological Program, I. S. Darevskii (Leningrad) on the principles and methods of studying the secondary productivity of terrestrial ecosystems in Warsaw in August, 1966, and A. G. Bannikov (Moscow) on the Ninth General Assembly of the International Union on Conservation in Lausanne in 1966.

After the informational reports, A. M. Alekperov (Baku) spoke on the significance of meteorological factors in the lives of amphibians and reptiles, V. A. Garanin (Kazan) on methods of censusing amphibians, Îu. P. Antipchuk (Kiev) on the function of the three-chambered heart in reptiles, G. A. Gimmelreich (Kiev) on the nature of the velum palatinum in crocodiles, Îu. P. Antipchuk (Kiev) on the functional morphology of the pulmonary vessels in reptiles, Îu. D. Chugunov (Moscow) came out against the hypothesis on the role of the pineal organ in the regulation of color change in amphibians, L. F. Nayarenko (Odessa) informed us about changes in the population numbers of lizards and snakes in the northeastern Black Sea region, G. A. Ishunin (Tashkent) about poisonous snakes in southern Uzbekistan. A paper by V. V. Kuznetsov (Alma Ata) was read, "On fossil turtles in the Kirghiz."

On the following day T. T. Talyzin (Moscow) spoke on the role of deceased Academician E. N. Pavlovskii in the study of poisonous animals. Afterward there followed the report of I. S. Darevskii (Leningrad) on the First International Symposium on Poisonous Animals and Their Poisons in Brazil in 1966, O. M. Bogomolets-Enrikes (Moscow) on poisonous Brazilian snakes, O. P. Bogdanov (Tashkent) on problems in the investigation of poisonous snakes in the USSR, T. T. Talyzin (Moscow) on antivenins, and A. A. Khutorianskii (Moscow) on reptile pathology.

Z. T. Barkagen (Barnaul) gave a review of the use of snake venom in medicine. The reports of T. A. Val'tseva (Moscow) on the destruction in the central nervous system caused by poisoning with cobra venom, V. T. Shevchenko and L. Sh. Mitel'man (Barnaul) on "The use of snake venoms for studying the thrombotic activity of lipids," and others, were of a more specialized nature.

On the last day L. P. Tatarinov (Moscow) reported on phylogenetic investigations in paleoherpetology, and L. I. Khozatskii (Leningrad) spoke on the evolution of armor in amphibians and reptiles. In addition, P. V. Terent'ev (Leningrad) reported on

"The monster of Lake Loch-Ness and Cheir," and there was a series of reports on specialized questions on the study of reptiles and amphibians.

The conference noted the necessity of regulating the excessive collecting of poisonous snakes in some instances.

It is planned to convene the third herpetological conference in two or three years.

P. V. Terent'ev

New Books & Reprints

Bronn's Klassen und Ordnungen des Tierreichs. Herpetological sections by C. K. Hoffmann. Reprinted 1967; all paperbound. Amphibia (1873-1878), $46.00; Reptilia, vol. 1, Turtles (1890), $35.00; vol. 2, Lizards (1890), $66.00; vol. 3, Snakes and Embryology of Reptiles (1890), $44.00. Available from R. Friedländer & Sohn, 1 Berlin 41 (Steglitz), Germany.

Das Tierreich. Recent herpetological parts:

80. Gekkonidae, Pygopodidae, Xantusiidae, by H. Wermuth, 246 p., $29.00.
81. Colubridae (Dipsadinae) by J. Peters, 20 p., $4.00.
83. Chamaeleontidae, by R. Mertens, 37 p., $6.50.
84. Uropeltidae, by C. Gans, 29 p., $3.50.
85. Ascaphidae, Leiopelmatidae, Pipidae, Discoglossidae, Pelobatidae, Leptodactylidae, Rhinophrynidae, by S. Gorham, 182 p., $27.00.
86. Agamidae, by H. Wermuth, 127 p., $18.00.

Available from R. Friedländer & Sohn (address above)

Zoological Record. Herpetological portions on microcards (vols. 1-85, 1864-1948), $56.00. Available from R. Friedländer & Sohn (address above).

Biologia Centrali-Americana, vol. 7: Reptilia and Batrachia, by A. Günther, reprinted 1966, paperbound, $35.00. 498 p., 76 pls. (black and white only) Available from R. Friedländer (address above).

Amphibians of Malawi [East Africa], by Margaret M. Stewart. 173 p., 67 figs., 20 color plates, 1967. $7.50 clothbound. Available from State University of New York Press, Albany, New York 12201.

Poisonous Snakes of the World, edited by S. A. Minton, Jr., H. G. Dowling, and F. E. Russell. Publ. U. S. Dept. Navy, Bureau of Medicine & Surgery. 212 p., 8 color plates, 1968. $3.25 clothbound from Supt. Documents, U. S. Government Printing Office, Washington, D. C. 20402.

International Symposium on Animal Venoms. Results of symposium held in São Paulo, Brazil, 17-23 July 1966. 347 p., available from Instituto Butantan, São Paulo. Includes sections on immunology, pathology of evenomation, prevention of accidents, and a long section on taxonomy of venomous animals.

There are 38 separate contributions. Some of the authors are B. Lutz, D. Cochran, J. R. Bailey, L. D. Brongersma, I. S. Darevsky, R. Mertens, A. Shulov, K. Klemmer, H. Saint-Girons, T. W. Betz, W. Beçak, A. Fain, N. C. McCollough, F. Kornalik, P. A. Christensen, A. do Amaral, A. Ohsaka, P. Cohen, and others. Titles are included in the Current Herpetological Titles list in this issue of the Review.

Amphibiens Urodèles de la Chine, by M. L. Y. Chang. 1936 (reprinted 1968). 165 p., 5 plates. The introduction by Arden H. Brame, Jr., includes a new, up-to-date checklist of Chinese salamanders. This book has just been published and copies will soon be sent to those who ordered them. For those who have not yet purchased a copy, please remember that these prices will be doubled shortly.

- Members: $3.00 paperbound; $5.00 cloth.
- Institutions: $6.00 paperbound; $10.00 cloth.

Send order to the Publications Secretary, SSAR: H. C. Seibert, Department of Zoology, Ohio University, Athens, Ohio 45701.

Style Manual for Biological Journals. 2nd edition, 2nd printing, 1967. 117 p., $3.00. Available from AIBS, 3900 Wisconsin Ave., NW, Washington, D. C. 20016, Attn.: Mr. Frank LoVerde; orders must be prepaid.

Current Herpetological Titles, II: 1967-1968

By H. G. Dowling, Itzchak Gilboa, and Irene Palser

GENERA OF REPTILES, American Museum of Natural History, New York, New York 10024.

****

THIS second list of current herpetological titles (see Herpetological Review no. 2 for first list) includes all 1968 titles received to 15 May and all 1967 titles that have come to our attention in the period 1 April to 15 May. A few titles have been obtained from secondary sources. Like the first list, this one is photo-offset reproduction of computer printout.

FUTURE: The file on 1967 literature is simply a list of titles, but the literature will be cross-indexed beginning with the 1968 list. This index is primarily for use with the overall Bibliography of Herpetology, and we have not decided whether or not to publish indices with the quarterly lists.

ACKNOWLEDGMENTS: The list was prepared with the aid of several departments of the Museum, and the Department of Zoology and Computer Laboratory of the University of Rhode Island. The project is supported by the National Science Foundation (NSF GN-707).

ON USING THE LIST: The list is arranged, as is customary, alphabetically by author, followed by the date, title, and journal reference. However, the names of junior authors are referred to the proper citations by "SEE" lines that are in the form of a code. Note, for example, the reference under "AMORIM, F. O." that says (SEE SCHG -967DVN: 135). The "SCHG" refers to a paper by Schreiber, G. . . . and F. O. Amorim (the code is derived from the first three letters of Schreiber's family name and the initial letters of his [first two] given names). The "967" is the year of publication, minus the initial "1", and the following "DVN" is derived from the initial letters of the first three significant words of the title (or subtitle, if the paper is one of a series). The number "135" after the colon is the initial page number of the article.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles. Regular dues are $4.00 worldwide and should be remitted (preferably via international money order outside the U. S. A. and Canada) to the Secretary-Treasurer. Members are invited to subscribe to the higher categories of Sustaining ($5.00), Contributing ($15.00), or Life ($100, in four payments of $25.00) membership. Institutional subscription is $6.00. A complete list of publications of The Ohio Herpetological Society and the Society for the Study of Amphibians and Reptiles is available from the Publications Secretary.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor. (address at bottom left)

■■■■

LAST YEAR'S SSAR MEETING.

The Society's tenth anniversary meeting was held on the campus of The Ohio State University in Columbus, 8-10 September 1967; it was sponsored jointly by the University, the Ohio State Museum, and the Columbus Zoological Gardens. In a letter of welcome addressed to former Society Chairman James C. List, the Honorable James A. Rhodes, Governor of Ohio, recalled the Society's founding in Columbus in 1958: "We Ohioans are most proud of our role in the establishment and perpetuation of the Society, and are aware of the appropriateness of its return to Ohio for the tenth anniversary meeting. . ."

A symposium, "The Biology of Salamanders," organized and moderated by Robert E. Gordon, was held on Saturday, September 9th. Participants were Victor H. Hutchison, Denzel E. Ferguson, Stanley N. Salthe, James A. Organ, Arden H. Brame, Jr., Joseph A. Tihen, Barry D. Valentine, and David B. Wake. An informal party was held in the evening at the home of Barry and Buena Valentine; Sherman Minton, Stephen Tilley, David Dennis, Glenn Gentry, and others each showed series of herpetological slides from their travels.

Members were treated to a tour of the Columbus Zoo's new reptile and amphibian house early Sunday morning, hosted by Curator Louis Pistoia. Contributed papers occupied the rest of the day in sessions presided over by Arnold G. Kluge and Ronald A. Brandon. Abstracts of all papers, including those in the symposium, appeared in the Journal of Herpetology (vol. 1, pp. 109-121, 1968). A total of 116 persons attended the meeting.

The Society wishes to record its gratitude to the authorities of the host institutions and to the many individuals who helped make the meeting a success. First, to Robert E. Gordon for organizing and moderating the symposium with his characteristic skill and wit, and to the symposium participants for their valuable papers and discussions. To the members of the local committee, Barry D. Valentine and John M. Condit, co-chairmen; Norton M. Rubenstein and David H. Stansbery, for excellent arrangements and facilities. To Stephen G. Tilley who organized a successful photographic display and to Kraig Adler who planned the program. Finally to those Friends of the Society who contributed financially to the support of the symposium. [see photographs on page 4]

●

1968 DUES.

If your 1968 dues have not yet been paid, a special form in enclosed for that purpose. The first issue of volume 2 and part 6 of the Boulenger series will be mailed in late May; these cannot be sent to individuals whose dues are in arrears.

NEW OFFICERS.

All Society officers nominated for the 1968-1969 term were elected; a list may be found on page 2 of this issue.

1967 MEETING SCENES. (left) Sunday Contributed Paper Session: Moderator Arnold Kluge, Speaker James Huheey. (center) Saturday Noon Banquet, Symposium Speakers (left to right): Denzel Ferguson, James Organ, David Wake, Barry Valentine, Society Chairman James List, Robert Gordon, Stanley Salthe, Victor Hutchison. Foreground: Gerry and Lowell Orr. (right) Coffee Break (left to right): Ronald Brandon, George Rabb, Carl Gans, Norton Rubenstein, James List (back to camera).

1967 MEETING GROUP PHOTOGRAPH. Left to right, ROW 1: David Dennis, James List, Ronald Brandon, Corson Hirschfeld, Floyd Downs, Richard Montanucci, Barry Valentine, Norris Denman, J. P. Kennedy, Gordon Thurow, Max Hensley, Henri Seibert, Joseph Tihen. ROW 2, Kraig Adler, John Cooper, Richard Worthington, Pat Worthington, Enoch Albert, James Huheey, Caroline Lusby, Sherman Minton, Madge Minton, William Posey, Mrs. Albert Reynolds, Albert Reynolds, David Ruffer, Joseph Collins. ROW 3, Clarence McCoy, Diane Secoy, William Byrd, Denzel Ferguson, John Woods, Victor Hutchison, Stanley Salthe, William Thomas, John Morris, Dolores Adler, Jane Collins. ROW 4, Arnold Kluge, Stevan Arnold, Henry Wilbur, Chris Stotler, Mrs. Chris Stotler, Arden Brame, David Grant, Edward Thomas, Patricia Zug, George Zug, James MacMahon. ROW 5, Mrs. Norris Denman, Curtis Allen, Mrs. Curtis Allen, Barbara Maple, Mrs. Lowell Orr, Lowell Orr, Glenn Gentry, C. R. Shoop, James Organ, Della Organ, Robert Gordon, D. H. Taylor. ROW 6, Linda Dennis, Margaret Stewart, Paul Lemon, William Maple, Lloyd Fitzpatrick, Gordon Forster, David Hardy, Janet Olmon, Ronald Lawson, David Wake, Howard Hintz, James Spotila. ROW 7, R. Martin, H. J. DeJongh, Carl Gans, James Fowler, Jr., Martin Cooper, Marvin Bobes, Steve Wood, Claire Zurbuch, Richard Franz, Norton Rubenstein, Diane Lange, Mary Tilley, Steve Tilley, George Rabb, William Hinchey. ROW 8, Rick Sinclair (top of head), Ralph Sinclair, James Fowler, Sr., Daniel Wonderly, Mark Fraker, Harry Jopson, Stephen Bass, Katherine Miller, Bruce McLean. Not Shown: James Vial, Bayard and Mrs. Green, John Condit, Charles Chantell, Eugene Schroeder, Louis Pistoia, Robert and Susan Kondik, Paul Daniel, Benjamin Banta, Mrs. Norton Rubenstein, Mrs. Ronald Lawson, Jerry Hardy, Sheldon Guttman, Anne Fraker, Mrs. John E. Cooper, D. Bonnett, Ray E. Ashton, Jr. Total, 116 persons.

OFFICERS RETIRE.

The Society wishes to thank three officers whose terms expired last December 31st, for their dedication and service. First, to James C. List who served as Chairman during 1966 and 1967, a particularly critical period in the Society's history during which name changes and restructuring of the organization was accomplished; Dr. List has been appointed Assistant Publications Secretary for the current term. Second, our thanks to Corson Jay Hirschfeld who served the Society in a variety of important capacities including Chairman (1962-1965) and more recently as Editor (1965-1967). He was instrumental in improving format and increasing the size of the Journal and in enlarging the newsletter into Herpetological Review. Last, we thank John M. Condit who has served well as Index Editor.

next SSAR meeting: august 1968

THIS SUMMER'S SSAR MEETING.

The Society will hold its eleventh annual meeting August 23-25, 1968, at the University of Virginia's Mountain Lake Biological Station, located in southwestern Virginia near the West Virginia border. The summer session will have ended by meeting-time and all Station facilities will be made available to the Society. Paper sessions will be held in the auditorium of the main laboratory building (see photo); meals will be provided in the Station's dining hall and sleeping accomodations in various cabins and dormitories. The Station is situated at an elevation of 4000 feet in the Jefferson National Forest; the mountains in this area are part of the Allegheny system and the Station itself rests directly on the Atlantic-Gulf watershed divide. Whitetop Mountain and Mt. Rogers (highest point in Virginia, 5720 ft.) are only 125 miles away by road; Grandfather Mountain, North Carolina, 175 miles; and the Great Smoky Mountains, 250 miles.

Preliminary plans are for the Board of Directors to meeting Friday evening, August 23d. The paper sessions are scheduled for Saturday and Sunday mornings, with several invited lectures on Saturday afternoon. There will be a social gathering Saturday evening and local field trips Sunday afternoon. A photographic display and an exhibit of live reptiles and amphibians from the Appalachian region are planned. Photos may be submitted by anyone and are to be sent to Kraig Adler, Museum of Zoology, The University of Michigan, Ann Arbor, Michigan 48104; photos will be returned immediately after the meeting. Be sure to include species and locality information for each photo.

Registration will be limited by the size of the Station's auditorium, which seats 100. The cabins and dining hall will accomodate an equal number, but there are excellent camping facilities nearby and a large hotel two miles from the Station on the south shore of Mountain Lake (see photo). Details on the program, local accomodations, and transportation will be mailed to each member in June. Harry G. M. Jopson of Bridgewater College (Virginia) and James A. Organ of the City University of New York are serving are meeting co-chairman. After June 10th, room reservations and programs may be obtained from Dr. Organ, c/o Mountain Lake Biological Station, Route 1, Pembroke, Virginia 24136.

MOUNTAIN LAKE SCENES. (left) Mountain Lake, looking south to Bald Knob (ele. 4363 ft) and Mountain Lake Hotel; Biological Station 2 mi. NE. Habitat of Natrix, Chelydra, Notophthalmus, Plethodon, Pseudotriton, Eurycea. (center) Main laboratory building; paper sessions to be held in auditorium here. (right) The "Cascades," waterfall on Little Stony Creek, 5 mi. W of Station. Habitat of Gyrinophilus, Eurycea, Natrix, Elaphe, Diadophis, and four species of Desmognathus.

SOCIETY MEETINGS.

American Society of Ichthyologists and Herpetologists: 48th Annual Meeting, Ann Arbor, Michigan, 16 to 20 June. Programs from Donald W. Tinkle, Museum of Zoology, The University of Michigan, Ann Arbor, Michigan 48104.

American Institute of Biological Sciences: Annual Meeting, Columbus, Ohio, 3 to 7 September.

Virginia Herpetological Society: Third Annual Open House, to be held at the Division of Reptiles and Amphibians, U. S. National Museum, Washington, D. C., 18 and 19 May.

HERPETOLOGY COURSES AT BIOLOGICAL STATIONS.

Herpetology courses are being offered this summer at several biological stations. The following three have come to our attention:

Mountain Lake Biological Station, near Blacksburg, Virginia. July 18-August 21; H. G. M. Jopson, instructor. Apply to Director, MLBS, c/o Department of Biology, University of Virginia, Charlottesville, Virginia 22903.

University of Oklahoma Biological Station, near Willis, Oklahoma. C. C. Carpenter, instructor. Apply to UOBS, c/o Department of Zoology, University of Oklahoma, Norman, Oklahoma.

"Tierra Alta," West Virginia Biological Station. June 17-July 19; J. P. Kennedy, instructor. Apply to Dr. Jay Barton, Department of Biology, West Virginia University, Morgantown, West Virginia.

PLEA TO CONSERVE THE TEXAS BLIND SALAMANDER AT EZELL'S CAVE, TEXAS.

The Texas Chapter of the Nature Conservancy has succeeded in purchasing Ezell's Cave near San Marcos, Texas, a locality for the subterranean Texas Blind Salamander, Typhlomolge rathbuni; the cave also hosts a wide variety of other equally bizarre species of animals. The Texas Chapter must repay the land-purchase loan made to it by the national organization, as well as erect a fence and a cabin for a caretaker; this totals nearly $16,000. Donations of any amount are solicited. Checks may be made payable to the Nature Conservancy and sent to: The Nature Conservancy, Texas Chapter, 909 Reliance Life Building, Dallas, Texas 75201. All contributions are deductable for income tax purposes.

This purchase is heartening news, for the cave's fauna had been threatened recently by commercialization. The Society strongly recommends support of this most worthy cause.

New Books & Reprints

Amphibiens Urodèles de la Chine, by M. L. Y. Chang. 1936 (reprint May 1968). 165 pages. The introduction by Arden H. Brame, Jr., includes a new, up-to-date checklist of Chinese salamanders. The following prices apply before publication only:
Members: $3.00 paperbound; $5.00 clothbound.
Institutions: $6.00 paperbound; $10.00 clothbound.
★ Place advance orders at once to take advantage of these temporarily lowered rates. Send orders to the Publications Secretary, SSAR: Henri C. Seibert, Department of Zoology, Ohio University, Athens, Ohio 45701. A special order form is enclosed.

The Life and Demography of the Side-Blotched Lizard, Uta stansburiana, by Donald W. Tinkle. 1967. Misc. Publ. no. 132, 182 pages. Univ. Michigan Mus. Zool., Ann Arbor. $3.75 paperbound; $4.75 clothbound.

The Caecilians of the World: A Taxonomic Review, by Edward H. Taylor. 1968 (to appear shortly). Univ. Kansas Press, Lawrence. About 900 pages. $20.00.

Lizard Ecology, a Symposium, edited by W. W. Milstead. 1967. Univ. Missouri Press, Columbia. 300 pages, $7.50 clothbound. Contributors: W. F. Blair, B. H. Brattstrom, C. C. Carpenter, W. R. Dawson, L. T. Evans, H. S. Fitch, J. E. Heath, H. Heatwole, W. W. Mayhew, W. W. Milstead, K. S. Norris, A. S. Rand, R. Ruibal, D. W. Tinkle, and V. A. Tucker.

The Hyoid and Its Associated Muscles in Snakes, by David A. Langebartel. 1968. Illinois Biol. Monogr. (Univ. Illinois Press, Urbana), no. 38, 156 pages. $4.95 paperbound.

Intrageneric Relationships Among Colubrid Snakes of the Genus Geophis Wagler, by Floyd L. Downs. 1967. Misc. Publ. no. 131, 193 pages. Univ. Michigan Mus. Zool., Ann Arbor. $3.00 paperbound.

Batrachia and Reptilia of Costa Rica, by Edward D. Cope. 1875 (reprint 1967). Extract from Jour. Acad. Nat. Sci. Philad., 70 pages. Available from: J. D. Villa, Departamento de Biologia, Universidad de Costa Rica, Ciudad Universitaria, "Rodrigo Facio," San Jose, Costa Rica. $2.00 paperbound.

The Caucasus Rocklizards, by I. S. Darevsky. 1967. Academy of Sciences, Leningrad, 214 pages [in Russian]. A detailed review of all parthenogenetic Lacerta and related species.

Classification der Batrachier, by J. J. von Tschudi, 1838 (reprint 1967). 120 pages. $4.00 paperbound; $6.00 clothbound. Send orders to the Publications Secretary, SSAR: Henri C. Seibert, Department of Zoology, Ohio University, Athens, Ohio 45701; a special order form is enclosed.

Living Turtles of the World, by P. C. H. Pritchard. 1968. New York, 288 pages; 155 color photos. $9.95 clothbound.

Elementary Probability for the Biological Sciences, by James E. Mosimann. 1968. 264 pages. Appleton-Century Crofts, New York. $1.95 paperbound.

Directory of Bioscience Departments in the United States and Canada. Publ. of Office of Biological Education, American Institute of Biological Sciences. Complete information on programs and staffs of 1,846 bioscience departments in 1,112 colleges and universities, plus 300 non-degree granting institutions; about 25,000 names of administrative and teaching faculty are listed. 1967. Address requests for Directory to Mr. Richard J. Burk, Jr., Assistant to the Director, AIBS Office of Biological Education, 3900 Wisconsin Avenue, NW, Washington 20016.

MICROFICHE. Microfacsimiles of books on transparent sheets of safety film, size 9 x 12 cm, each card containing 40-70 pages of text. Catalogue available from Inter Documentation Co. AG, Poststrasse 9, Zug, Switzerland. Some herpetological titles are listed below:

Baur, G. 1888. Beitrage zur Morphologie des Carpus und Tarsus der Vertebraten. I. Amphibien. 86 p., 3 pls. $1.80

Gray, J. E. 1828. Spicilegia Zoologica. 12p. $1.90

Seba, A. 1734-1765. Locupeltissimi rerum naturalium thesauri accurata descriptio et iconibus. . . 4 vols., no price listed.

Tschudi, J. J. 1844-1846. Untersuchungen uber die Fauna Peruana. 3 vols. [incl. herpetological section] $13.90

Cocteau, J. T. & G. Bibron. 1841-1843. Reptiles [In de la Sagra, Historia fisica, politica y natural de la isla de Cuba]. $3.40

Duméril, A. M. C. and G. Bibron. 1834-1854. Erpétologie générale. .des reptiles. 10 vols. $6.40

Ecker, A. 1864-1882. Anatomie des Frosches. $4.20

Fayrer, J. 1872. Thanatophidia of India. 156p. $7.40

Gunther, A. 1864. Reptiles of British India. $8.90

Guichenot, A. 1850. Histoire naturelle des reptiles et poissons. . de l'Algerie. $3.10

Haller, A. v. 1758. Historia Naturalis Ranarum. 115p. $7.80

Holbrook, J. E. 1842. North American Herpetology. 5 vols. $14.40

Laurenti, J. N. 1768. Specimen medicum exhibens synopsin reptilium. 214p. $2.90

Mason, J. J. 1879-1882. Minute structure of the central nervous system of certain reptiles and batrachians of America. Newport, 40p. $2.60

Peters, W. 1882. Naturwissenschaftliche Reise nach Mossambique. . III. Amphibien. 200p. $4.90

Roesel von Rosenhof, A. J. 1758. Historia naturalis Ranarum nostratium. 120p. $6.20

Schinz, H. Naturgeschichte und Abbildungen der Reptilien. 1833-1835. 240p. $2.10

Schlegel, H. 1837-1844. Abbildungen neuer oder unvollstandig bekannter Amphibien. $2.90

Schreiber, E. 1875. Herpetologia Europaea. $6.40

The section which follows is a new addition to this newsletter. In the past, the Society has published lists of recent literature in its newsletter, recognizing the problem caused by the several years delay in publication of Zoological Record and the incompleteness of Biological Abstracts. This attempt never pretended to be comprehensive. The computerized lists which begin in this issue should provide current listings of most of the herpetological literature for a given period of time. The Society is indeed pleased that its newsletter has been chosen as the medium for publication of these useful lists.

In the past, extra copies of newsletters have not been printed beyond current needs and thus back-issues were not available. However, the addition of the new literature lists greatly increases the usefulness of the newsletter, at least for a few years after publication of each issue. For this reason, we are planning to print extra copies, hopefully enough to supply workers in the interim before the appearance of Zoological Record. Single issues will cost $1.00 each postpaid and may be obtained from the Publications Secretary (address on page 2). -- Ed.

Current Herpetological Titles: 1967

By H. G. Dowling, Itzchak Gilboa, and Irene Palser

GENERA OF REPTILES, American Museum of Natural History, New York, New York 10024.

* * * *

CURRENT publications in the field of herpetology seem to be in the order of 3,000 accounts annually, including species descriptions, faunal works, checklists, and other reports. This field is almost unique in biology in that few comprehensive works appear. The "information explosion" is our most serious problem, yet there has been no systematic attempt to consolidate herpetological information in this century. While efficiency in research involves at least a general scanning of relevant current literature, this task, with the output doubling about every ten years, becomes more difficult and time-consuming every year.

The following photo-offset reproduction of computer printout from magnetic tape of a partial bibliography of the herpetological literature of 1967 is an example of one aspect of the work being done here to consolidate and make available the total output of herpetological data. The incomplete list contains only those titles obtainable since the inception of the GENERA OF REPTILES project on 1 January 1968 and includes only those published during 1967. The literature search included the journals and books received by the Library and the Department of Herpetology of this Museum, together with reprints sent directly to us up to 31 March 1968. A few titles have been obtained from secondary sources.

Among the purposes of publishing this list is to give herpetologists a better idea of the present scope of the field and to indicate the diverse sources of information on amphibians and reptiles. Another is to demonstrate the broad "gray area" that is occupied by papers that describe the use of amphibians or reptiles in some field of research -- this field often being distant from the usual interests of biologists who work on anatomical, behavioral, systematic, evolutionary, ecological, or (whole-animal) physiological studies.

The major concern of the project is the search for, cross-indexing of, and (where pertinent) the microfilming of important segments of herpetological literature. The ultimate objective of this work is to consolidate this information in a file that allows easy access from systematic, geographic, and subject routes. To accomplish these aims, all included information is placed on IBM punched cards and microfilm aperture cards.

Future: The file on 1967 literature is simply a list of titles, but the literature will be cross-indexed beginning with the 1968 list. This index is primarily for use with the overall Bibliography of Herpetology, and we have not decided whether or not to publish indices with the quarterly lists. The first quarterly list of 1968 literature should be ready for printing in May.

Acknowledgments: This list was prepared with the aid of many persons in the Herpetology Department, the Photography Department, and the Library of the Museum, and with the help of various individuals in the Department of Zoology and the Computer Laboratory of the University of Rhode Island. The project is supported by the National Science Foundation (NSF GN-707). We thank all of these persons and institutions, and especially James E. Bradley, Operations Manager, and Harlan S. Hersey, Programmer, of the URI Computer Laboratory.

On Using The List: The list is arranged, as is customary, alphabetically by author, followed by the date, title, and journal reference. However, the names of junior authors are referred to the proper citations by "See" lines that are in the form of a code. Note, for example, the reference under "Abrams, Gerald D.," that says, "See JOIGN-967 ETL: 942." The "JOIGN" refers to a paper by Joiner, Gary N. (the code is derived from the first three letters of his family name and the initial letters of his [first two] given names), and Abrams. The "967" is the year of publication, minus the initial "1", and the following "ETL" is derived from the initial letters of the first three significant words of the title (or subtitle, if the paper is one of a series). The number "942" after the colon is the initial page number of the article.

Although the coding may at first appear cumbersome, it is actually a brief and explicit reference to a publication. In spite of some authors publishing more than one paper with the same title in a given year, the code so far has allowed us to allocate the information to the proper citation.

A REQUEST TO THE READER

We would appreciate your critical comments on this first effort, in the hope that subsequent works will be improved thereby. We would like to know if you find such a list of current titles helpful, how much time you spent reading it, how many papers of interest it brought to your attention, what you think about coverage, timeliness, format, and other aspects of its makeup.

We would like to know if you note the absence of any pertinent journals in your field, if any journals noted here are brought to your attention for the first time, and whether or not such journals are available in your library.

We would like to hear from you on your feelings about the practicability of a "HERPETOLOGICAL INFORMATION CENTER," what benefit you would hope to derive from it, what it would be worth to you, any ideas you might have on financing such a service. In other words - we will appreciate any comments that pertain to this work that we have begun.

SOCIETY FOR THE STUDY OF AMPHIBIANS AND REPTILES

The Society was founded in 1958 as The Ohio Herpetological Society. Following rapid growth of membership and expansion of operations, due largely to the diversity and originality of its publications program, the organization became the Society for the Study of Amphibians and Reptiles in 1967. Publisher of the Journal of Herpetology, Herpetological Review, and Facsimile Reprints in Herpetology (all of which are received by members), the Society has an international membership open to all persons interested in amphibians and reptiles. Regular dues are $4.00 worldwide and should be remitted (preferably via international money order outside the U. S. A. and Canada) to the Secretary-Treasurer. Members are invited to subscribe to the higher categories of Sustaining ($5.00), Contributing ($15.00), or Life ($100, in four payments of $25.00) membership. Institutional subscription is $6.00. A complete list of publications of The Ohio Herpetological Society and the Society for the Study of Amphibians and Reptiles is available from the Publications Secretary.

HERPETOLOGICAL REVIEW

Herpetological Review is published irregularly and is received by all members & subscribers of the Society for the Study of Amphibians and Reptiles. Any original herpetological material other than biological research will be considered for inclusion in the Review and is earnestly solicited. Authors should first write to the Editor before submitting feature articles. Unpublished photographs of unusual nature or of uncommon amphibians or reptiles are desired; prints, preferably larger than they would appear when published, should be accompanied by exposure data, if available, and descriptive caption. Contributor's name & address should be taped or penciled on back of print; photos not published will be returned. Members may place ads in the classified section without charge. Letters from readers pertaining to the field of herpetology may be published, with writer consent, if deemed of interest by the Editor. If desired, reprints of contributions can be supplied. The Review will accept commercial advertising; rates are available from the Editor. Herpetological Review is edited by Corson Jay Hirschfeld, 9045 Indian Ridge Road, Cincinnati, Ohio 45243.

introduction...

It has always been our intent that the Society's operations effectively meet the varied needs of our diverse membership; when possible we have sought to render to our members services elsewhere unavailable. Thus, for example, in addition to our scientific Journal, we began publication of our successful facsimile reprint program. Our informal newsletter has been the only such publication widely available to herpetologists.

We have become aware of substantial interest among members in the non-technical material which has appeared from time to time in the Journal and regularly in the newsletter, such as literature lists, reviews, news notes, and biography. In fact, this interest is sufficient to justify our increasing the publication of this sort of literature. The format of the old newsletter would not favorably allow inclusion of lengthy material, and combining scientific, popular, and trivial matter under one cover (i. e., in the Journal) would be problematical, since scientific and non-technical articles do not necessitate or even lend themselves well to the same format, editorial attention, and so forth. Consequently, we are restricting biological research to the Journal and publishing semi- and non-technical material in our new-format informal publication, Herpetological Review.

Herpetological Review incorporates the Ohio Herpetological Society Newsletter. Its primary function, as the name states, will be to review herpetology, past and present, in terms of the individuals, institutions, literature and other components of the field. Perhaps equally important, the Review will provide a unique means of communication among persons interested in amphibians and reptiles. We believe it will be of interest to both the amateur and professional and we hope all members will find it informative and entertaining. Future issues will contain, in addition to the type of material in this first number, letters from members and commercial advertising. We anticipate articles on history, biography, and the status of herpetology in various countries. Other features will be added as indicated by your interest.

—Corson Jay Hirschfeld, Editor

LIFE, CONTRIBUTING & SUSTAINING MEMBERS

We gratefully acknowledge the following persons who have subscribed for 1967 to the higher Society membership categories: the Life, Contributing and Sustaining memberships. As the Society operates on a limited budget, this support is of meaningful benefit and allows expansion impossible through regular income.

titles and selected abstracts
of papers presented at

THE FIRST HERPETOLOGICAL CONFERENCE OF THE USSR

by ROZELLA B. SMITH,
TOM LEWIS
and HOBART M. SMITH

On 12-14 October 1964 the first herpetological conference of the USSR was held in Leningrad under the chairmanship of Dr. Paul V. Terent'ev.* Abstracts of 74 papers, selected for their broad significance and impracticality of presentation at the Conference, were published in a separate, 84 page pamphlet distributed at the meetings. The papers presented for the most part complemented and did not duplicate the abstracted papers. Several of the papers presented in these sessions but not abstracted are: (1) L. I. Khozatskii, Leningrad: "The history of the herpetofauna of the USSR"; (2) A. G. Bannikov, Moscow: "Prodrome of a monograph on the herpetology of the USSR"; (3) I. S. Darevskii, Leningrad: "Parthenogenesis in reptiles"; (5) L. Berger, Poland: "On interbreeding of Green frogs"; (6) I. K. Murygina, Tula: "The role of adders in nature in Sakhalin"; and (7) P. V. Terent'ev, Leningrad: "The interrelationships of frogs of the Palearctic and Nearctic." Presumably these and all other papers involved in the Conference, abstracted or not, eventually will appear in a symposium volume.

We present below in English the title, length of abstract (varying from 13 to 127 lines) and, where appropriate, a brief statement of content, for each of the 74 papers summarized in the abstract brochure (microfilm copies available from the University of Illinois Library, $1.50): Voprosy Gerpetologii /Problems of Herpetology/. Paul V. Terent'ev, editor. 1964 /12 October/. University of Leningrad. 84 p., 8 vo., paper-covered, stapled, printed pamphlet. Titles are not always literally translated. Transliterations conform with the Library of Congress convention. Scientific names in parentheses or unenclosed were given in the abstracts; those in brackets were supplied by us on the basis of common names used in the abstracts and the corresponding scientific names for them given in Terent'ev's summary of 1956. **

1. Alekierov, A. M. (Azerbaijan Univ.) Herpetogeny of Azerbaijan. (53 lines)

2. Aliev, F. F. (Academy of Science, Azerbaijan SSR, Zoological Institute.) Change in range and population of reptiles under the influence of climatic and anthropogenic factors in various parts of Azerbaijan. (51 lines)

3. Andrushko, A. M. (Leningrad Univ.), and N. N. Banina (Academy of Science, USSR, Institute for the history of natural science.) Infection of the green toad (Bufo viridis) by opalinids in Uzbek. (29 lines)

4. Bazhanov, V. S. (Academy of Science, Azerbaijan SSR, Zoological Institute.) Tracks of early tetrapods in Kazakh. (26 lines) Foot and tail tracks were found in 1960 in copper mines in formations 300 feet below the ground surface in strata of the late Carboniferous. Chirotherium tracks were taken in the Bakanamov region in the lower Permian.

5. Bannikov, A. G. (Veterinary Institute, Moscow.) Geographical and ecological features of the herpetofauna of tropical forests of southwest China. (29 lines) A brief statement of the number of species of the more characteristic genera of herpetozoa in the area south of the Mekong Basin is accompanied by a series of most provocative generalizations. Despite absence of marked seasonal variation in temperature, reproduction is strongly seasonal in both amphibians and reptiles. The summer rainy season is the reproductive season for all amphibians because of the high humidity, and for aquatic amphibians because of the high oxygen content of surface water; it is the reproductive season for reptiles because of the activity and abundance of food in the form of insects, amphibians and birds. The abundance of amphibians reproducing out of water is a product of the abundance of aquatic predators, especially dragonfly nymphs. The nocturnal activity of amphibians (except Kaloula) is

*See "The First Herpetological Conference of the USSR," by the authors of the present article (Bioscience, 15(12):801-2, 1965), for a discussion of the background and significance of the Conference.

** Terent'ev, Paul V. 1956. Praktikum po zoologii pozvonochn'ikh /Manual of vertebrate zoology/. Moscow. 520 p., 172 figs. (Herpetology, p. 185-273, figs. 58-129.)

related not to temperature and humidity but to insect activity. The abundance of arboreal and aquatic forms of lizards and amphibians, and scarcity of terrestrial forms, is a product of absence of ground cover and food.

6. Barkagan, Z. S. (Medical Institute, Barnual.) Clinico-experimental analysis of a few of the main problems of pathogenesis and the therapeutics of poisoning by vipers. (127 lines) A succinct, inclusive summary is given of chemicophysiological effects of venom of Vipera berus, V. lebetina and Echis carinatus introduced experimentally by various routes, and of treatment for snake bite. Antivenin and suction are recommended, accompanied by varied palliatives for the vascular and hematological distrubances caused by the venom. Most of the abstract concerns the latter subject. Notable points include: (1) the edematic-hemorrhagic syndrome is more pronounced in man, necrosis in laboratory animals; (2) intravenous envenomation produces death before edematic-hemorrhagic signs develop; (3) preliminary injection of heparin reliably averts fatalities from intravenous envenomation of up to 10 MLD; (4) tagging of blood proteins shows that systemic vascular permeability increases by average about twice, with the greatest increase occurring at the site of envenomation, in the lungs, liver and kidneys, the least in the brain; (5) shock from snake bite is two-phased; (6) envenomated blood passes through first a coagulation phase, then a phase of incoagulability; (7) heparin is contraindicated in the incoagulable phase; (8) blood transfusion is of great value in offsetting hemorrhagic effects; and (9) cauterization, phlebotomy, local use of potassium permanganate and internal use of alcohol are contraindicated.

7. Belova, Z. V. (Moscow.) Qualitative analysis of food of tadpoles of the lake frog /Rana ridibunda/. (16 lines)

8. Berdongraov, K. (Alma-Ata Veterinary Institute.) Heart activity in snakes after full discontinuation of respiration. (15 lines)

9. Bogdanov, O. P. (Academy of Science, Uzbek SSR, Institute of Zoology and Parasitology.) Factors influencing the reproduction of lizards in Central Asia. (44 lines) The larger (older) examples of all species breed 10-15 days earlier than smaller (younger) examples, and lay more eggs. Protracted spring extends ovulation to an entire month. The greatest variation of date occurs in cultivated areas, the next greatest in sandy areas, least in cliff areas. Psammophilous species reproduce later than those living on hard substrates, and individuals inhabiting rugged terrain reproduce earlier than those of plains areas. Rainy periods followed by warm weather causes rapid ova maturation, which almost ceases in protracted dry weather.

10. Borkhvardt, V. G. (Leningrad Univ.) Some lines of evolution of the vertebral column of secondarily aquatic reptiles. (35 lines)

11. Vasil'ev, B. D., and G. N. Sitkin. (Moscow Univ.) Exteroception of reptiles and amphibians. (67 lines) Outstanding recent discoveries are summarized; some authorities and dates are cited. Short-distance orientation of reptiles by sun position, and long-distance navigation of sea turtles by the stars, are noted.

Nocturnal species (e. g., Bufonidae, Palobatidae) lack color vision, crepuscular types have little (e. g., Limnodynastes tasmaniensis sees only dark blue). Diurnal species have good color vision: Rana pipiens, R. clamitans, B. bombina distinguish all basic colors, Discoglossus pictus yellow only, Rana latastei yellow and yellow-green, Rhacophorus buergeri and Leptodactylus ocellatus orange, yellow and yellow-green, Ceratophrys americana red and dark blue. Among reptiles, Emys orbicularis, Clemmys caspica, Lacerta agilis, L. viridis and Anolis carolinensis distinguish five to eight colors, and several species differentiate shades of red-yellow. Infra-red photoreception is suspected and requires further study.

Snakes have been shown to be deaf to air-borne sounds, receptive to ground-borne sounds. Recent experiments prove sound reception of air-borne waves does occur in turtles. Tachydromus hears frequencies as high as 12,500 cps., amphibians 12,000 to 15,000 cps.; Rana catesbeiana may perceive ultra-high frequency waves.

Xenopus laevus is highly chemoreceptive; severance of its Jacobson's organ nerve does not diminish the sensitivity.

Thermoreception is proved for crotalid snakes distinguishing temperature differences as small as a few thousandths of a degree.

Turtles react strongly to X-rays.

12. Voĭtkevich, A. A. (Voronezh Medical Institute.) Patterns of duplication in supernumerary formations of the posterior appendages in frogs in nature. (56 lines)

13. Gaĭzhauskene, I. I. (Kaunas.) The amphibian fauna of Lithuania and its biology. (27 lines)

14. Garanin, V. I. (Academy of Science, USSR, Kazan.) History of the herpetology of the Volzhsk-Kamska region. (38 lines) A strictly historical survey of herpetological publication on the area, from Pallas in 1831 and Eversman in 1834 to the present. A gradual shift to ecological, economic and other aspects, rather than faunistics, is noted, beginning in the 1920's and now nearly complete. Thirty authors are mentioned.

15. Gramenitskiĭ, E. M. (Medical Institute, Leningrad, Department of Public Health.) Seasonal cytochemical changes in the cutaneous glands of the grass frog /Rana temporaria/. (26 lines) One-hundred eighty grassfrogs studied over a three year period reveal that in winter, spent under water, the granular and small mucous glands are quiescent, the large mucous glands active. Emerged from hibernation, just the reverse of glandular activity occurs. In the active glands, in both situations, the RNA, proteins and NH_2 groups are markedly increased.

16. Darevskiĭ, I. S. (Academy of Science, USSR, Leningrad, Zoological Institute.) Ancestral signs in hybrids as an indication of phylogeny of a group of cliff lizards /Lacerta saxicola/ of the subgenus Archaeolacerta. (47 lines) Lacerta saxicola mixta apparently arose by hybridization of L. derjugini and L. saxicola. L. s. dahli has a double postnasal scale, practically never found in other forms of saxicola but normal in L. graeca, L. oxycephala and other adjacent southern species. Hybrids between the parthenogenetic and bisexual subspecies of L. saxicola have enlarged dorsal head scales like the adjacent L. horvathi which in turn has a color pattern

like L. s. mixta. The presence of six of the nine species of L. (Archaeolacerta) in southern Europe along with 13 species of L. (Podarcis) suggests an ancient center of species-formation there. L. saxicola is a more recent invader from Asia, as indicated by the existence in its hybrids of several traits of more ancient European forms.

17. Dudusenko, L. M. (Kishinev Univ.) Lizards of Moldavia. (38 lines)

18. Droedov, N. N. (Moscow Univ.) Biology of the green-bellied lizard (Lacerta chlorogaster). (53 lines) The ribbon-like range follows small valleys in mountainous forested regions of Azerbaijan. In settlements of medium density the lizards live 25-35 meters apart, and reach their maximum density at 1/100 m^2. Territories are strongly defined, with one or two good hideouts in each, on a treetrunk or in rocky fissures. Food, date of egg-laying, number of eggs, hatching dates, size of young and ectoparasites are summarized. Strong sexual dichromatism develops in spring and disappears by July. Stereotyped behavior was studied but not summarized in the abstract.

19. Egorov, P. S. (Tashkent.) The history of the study of poisonous snakes and their venoms in Central Asia. (92 lines)

20. Zhavoronkov, A. A. (Dushanbe.) Influence of heparin on the morphological picture of experimental envenomation by menas of viper venom. (74 lines) Experiments on rabbits demonstrate that injection with therapeutic intent of heparin into the victim of viper bite is fraught with major hazards connected with aggravation of vascular permeability and of the hemorrhagic syndrome.

21. Ziniakova, M. P. (Academy of Science, Uzbek SSR, Institute of Zoology and Parasitology.) Rate of growth of the Central Asiatic viper [Vipera lebetina] in captivity. (6 lines, table of 7 lines) Seven hundred eighty-one specimens, 255-1500 mm in total length, were put in a terrarium from 28 April 1961 through 25 May 1962; 299 remained alive by 10 October 1962. Growth records show that the smallest specimens grew the most (0.25 mm/day), and the largest the least (0.04 mm/day). None of the smallest failed to grow, whereas 59% of the largest were not observed to grow.

22. Iordanskiĭ, N. N. (Moscow Univ.) Phylogeny of modern crocodiles. (58 lines) A brief review of the phylogeny of Crocodylia, basically following Huene's theory rather than that of Fraas and Kälin.

23. Il'ichev, V. D. (Moscow Univ.) Evolution of the external ear of terrestrial vertebrates. (49 lines) The most progressive groups of reptiles (lizards, crocodilians) exhibit the greatest development of the external ear in their class. All functional stages occur, from the simple slit to the depressed meatus and finally to the marginal, megaphonic ornamentations. The adaptation is as profound as the middle ear can accommodate in harmony with the behavioral efficiency of any given species in its environmental niche. The functional stages evident in reptiles are paralleled in the evolution of terrestrial vertebrates in general. Otic perfection has been of great significance in speciation in many tetrapod lines, leading to the development of numerous analogies and parallelisms in structure of the external ear in amniotes.

24. Ishunin, G. I. (Academy of Science, Uzbek SSR, Zoological Institute.) Food of sand vipers [Echis carinatus] in Usbek and Turkmen. (18 lines)

25. Ishchenko, V. G. (Academy of Science USSR, Ural'sk Biological Institute.) Discoveries of the Siberian Hynobiid [Hynobius keyserlingi] in the north. (16 lines) At 60° 40', on the shores of a tundra lake near the Khadytaiakh River, and in the northern Urals in the Ob River valley, about 67°, specimens were found on several occasions in August. Females bore eggs ready to lay the following year. Young still possessed gills but were on land.

26. Kanen, S. V. (Leningrad Univ.) A mathematical analysis of insular lizard faunae. (21 lines, 1 table) Terent'ev first noted the close relation between area and number of species of lizards on oceanic islands. We have extended his formula $y = bx^a$, accounting for 90% of known variation in number of species on different islands by adjusting for surface irregularity, climate and area.

27. Kalashnikov, V. P. (Academy of Science, Usbek SSR, Institute of Zoology and Parisitology.) Physiology of the gaseous interchange in poisonous snakes of Asia. (86 lines)

28. Kas'ianeko, V. G. (Academy of Science USSR.) The role of comparative-anatomical research in the field of herpetology for interpretation of the paths and conformity to the law of evolution of the organs and systems in mammals. (43 lines)

29. Kistiakovskiĭ, A. B., and L. A. Smogorzhevskiĭ. (T. G. Shevchenko Univ., Kiev.) New data on range-expansion of reptiles and amphibia in Priamurye. (19 lines)

30. Kotliarevskaia, V. A. (Novosibirsk.) Local migrations of five anurans. (44 lines) Recaptured specimens, of 491 marked by finger-clipping, of five species of terrestrial frogs [Rana esculenta, R. ridibunda, R. temporaria, R. terrestris, B. bombina] near L'vov, Poland, revealed marked differences between the species in extent of migration from spring breeding ponds, and in habitat preferences during the summer.

31. Krapivnĭ, A. A. and M. I. Kroshchenko. (Vitebsk.) Herpetology in northern Byelorussia. (13 lines)

32. Krolenko, S. A. and N. N. Nikol'skiĭ (Academy of Science USSR, Cytological Institute.) Heat stability of muscle tissue of some amphibians of southeastern Asia. (17 lines)

33. Kuznetsov, V. V. (Academy of Science, Kazakh SSR, Zoological Institute.) Freshwater turtles of the Mesozoic and Cenozoic of Kazakh. (45 lines)

34. Kushniruk, V. A. (L'vov Univ.) Hibernation of amphibians in the southern Ukraine. (27 lines) Lake frogs [Rana ridibunda] were found hibernating in silt on the bottom of a pond; grass frogs [R. temporaria] and sharp-muzzled frogs [R. terrestris] in silt under 1.2 m of water in peat bogs. With the latter were found pectinate tritons [Triturus cristatus]. Carpathian tritons [T. vulgaris] hibernate in the subalpine zone on dry land under fallen logs or rocks, and in stumps; larvae at subalpine levels hibernate in water, not transforming until the following spring, whereas at lower altitudes

they metamorphose before winter and hibernate on land. Spotted salamanders hibernate in caves, under rotten stumps, in piles of leaves, in holes in the ground.

35. Parionov, P. D., N. G. Solomonov and G. P. Parionov. (Yakutsk Univ.) The dispersal and biology of amphibians and reptiles in Yakut ASSR. (50 lines)

36. Lesniak, A. P. (Academy of Science, Usbek SSR, Institute of Zoology and Parasitology.) Food of /Agkistrodon halys/ in populations of the great sand dunes of southern Pribalkhash. (31 lines)

37. Lukina, G. P. (Rostov on the Don.) Herpetofauna of western Caucasus minor. (22 lines)

38. Mazhuga, P. M. (T. G. Shevchenko Univ., Kiev.) Homologies of the circulatory trunks of the appendages of terrestrial vertebrates. (83 lines) Homologous appendicular vessels commonly are given different names and are thought to be merely analogous in different groups of tetrapods, although there is no question of homologies of bone and muscle. On the contrary, rudimentary capillary systems embryonically precede vessel formation; vessels appear in correlation with the parts that develop most importantly. Thus vessels are firmly correlated with their "nourishing" organs not only morphologically and functionally, but also ontogenetically. However, only vessels connected with homologous appendicular organs can be regarded as homologous.

39. Mazurmovich, B. N. (T. G. Shevchenko Univ., Kiev.) Present status and problems of the study of the parasitofauna of amphibians and reptiles of the USSR. (77 lines)

40. Manzil', S. F. (Academy of Science Ukraine SSR, Zoological Institute.) Some problems on the evolution of cheiroptergia in the light of data on structure of the pectoral appendages of amphibians and reptiles. (79 lines) Important light on problems of evolution of cheiropterygia can be obtained from a study of living and fossil herpetozoa. Our investigations show that transition from synchondroses to diarthroses was the chief factor in modification of the ichthyopterygium to form the cheiropterygium; modern amphibians like frogs and ambystomids have an intermediate type of articulation, agonarthrosis. Autopodial locomotion is not primitive; it first appeared in Permian cotylosaurs, whereas Devonian stegocephalians had zeugopodial-autopodial locomotion. In mammals the carpals, unlike the digits, lack tendinous attachments, except for the pisiform; several carpals have them in reptiles. The pisiform appears to be a modified radial since it has ligamentous connections like the digits. The dual origin of the hamate is supported by the separate elements that represent it in Varanus (with synchondrosis) and Emys orbicularis (with syndesmosis).

41. Markuze, V. K. (V. I. Lenin Pediatrics Institute, Moscow.) The ecological role of certain frogs and snakes in the fish hatcheries of the Volga Delta. (48 lines) The lake frog /Rana ridibunda/, contrary to popular opinion, preys very little on fry in fish hatcheries. Stomach analyses of 1400 frogs indicate only 0.06-0.08% of the fry are eaten by frogs, which subsist primarily on invertebrates although in sluice areas with abundant fry 91% of the frogs eat them (mean of 9/stomach). Availability dictates dietary importance; ants and bees are common.

Water grass-snakes /Natrix tesselata/ eat 0.13-0.31% of the fry (260 stomachs examined). The species lives almost entirely on fish, but the population is small, about 750 in a 690-hectare hatchery.

Common grass-snakes /Natrix natrix/ feed almost entirely on lake frogs. The population is large, about 4000-5000 in a 690-hectare hatchery.

42. Movchan, N. A. and N. S. Gabaeva. (Leningrad Univ.) On the antibiotic properties of the egg envelopes of grass frogs /Rana temporaria/ and steppe turtles /Testudo horsfieldi/. (38 lines) The jellylike evnelopes of the eggs of the grass frog and the albumen of the eggs of the steppe tortoise experimentally were shown to have strong antibiotic action on a wide spectrum of microorganisms. Histological study of freshly-collected frog eggs revealed bacteria only on the outer surface of the gelatinous envelopes.

43. Nedialkov, A. D. and A. I. Kochevskiĭ. (Tashkent.) Winter activity of the viper /Vipera lebetina/. (22 lines)

44. Nurumov, T. N. (Academy of Science, Kazakh SSR, Zoological Institute.) Occurrence of dinosaur remains in Kazakh. (33 lines)

45. Okulova, N. M. (Academy of Medicine USSR, Institute of poliomyelitis and virus encephalitis.) The biology of the roundheads of western Kazakh. (17 lines) In May and June /Phrynocephalus guttatus/ and /P. mystaceus/ were observed. A large percentage of young is found at all times, even in spring (80-82%), and females predominate throughout the year. The lizards are omnivorous; vegetation is often eaten, as well as insects, earthworms, and other invertebrates. Egg-laying is described.

46. Okulova, N. M. (Academy of Medicine USSR, Institute of poliomyelitis and virus encephalitis.) Notes on the biology of the variegated lizard in western Kazakh. (30 lines) In April-June along a 131 km route /Eremias arguta/ was found 1.98/km in a clay-soil desert, 2.4/km in sandy desert, the young comprising 25-30% of the population. The young comprise 60-70% of the population in August, 80-85% in September-October. Male-female ratio is 100 to 130 in April, 100-130 in June, 100-100 in fall due to the young. Sexual maturity occurs in the second year, at a length of 55 mm. Ovarian activity persists throughout the year while not in hibernation. Broken tails occur in 2.8% of the population.

55. Sviridov, A. I. (Medical Institute, Kiev.) On the intraorganic lymphatic vessels of reptiles. (36 lines) Injections of 47 reptiles (turtles, crocodilians, squamatans) revealed that lymphatic capillary networks in several organs (e. g., stomach, intestine) are better developed (with a greater density, increase in number of layers, etc.) than in mammals.

56. Sokolov, V. E. (Moscow Univ.) Adaptive features of the integument of amphibians of the SSSR. (34 lines)

57. Strautman, F. I., B. F. Sukhomlinov, V. A. Kushniruk and N. D. Chugunov. (L'vov Univ.) Electrophoretic research on blood-serum proteins of various amphibians. (31 lines)

58. Strelkov, P. P. (Academy of Science USSR, Zoological Institute.) The significance of the lake from /Rana ridibunda/ in maintenance of fish hatcheries of the Volga delta. (88 lines) Stomachs of over 500 frogs revealed extensive change in diet during the year. In May and early June the basic diet is ground insects; at dusk a mass exodus occurs to land in search of food. By mid-June the exodus ceases as the frogs feed (80% of stomachs examined) on tadpoles and, later, the young at transformation, supplemented somewhat with aquatic invertebrates and (5%) small fish. Frogs in nearby natural bodies of water similarly shifted from terrestrial to aquatic foods, although no fish were encountered in their stomachs. Only where and when young fish were badly overcrowded did frogs subsist primarily on fish. Frogs are never importantly detrimental in pisciculture unless the fish are overcrowded. Contrariwise, they divert the activities of numerous predators (e. g., snakes, birds) which would, in the absence of frogs, eat fish, and they in turn prey upon numerous aquatic enemies (e. g., dragonfly larvae) of fish. The only desirable control measure is restriction of access in times and places where young fish must be impounded in overcrowded conditions.

59. Strel'nikov, I. D. (Leningrad.) Biometrical relations of brain and body in herpetozoa. (87 lines) A general discussion of the most basic relations of brain and body size, with very few illustrative data. Three relations are well established for endotherms: (A) the less the weight of any species, (1) the greater the relative weight of the brain, and (2) the higher the metabolic rate; and (B) the less the average weight in adults of the species of any systematic group, the greater the number of species.

After analysis of the scattered data now available, it is concluded that some of these relations pertain also to herpetozoa; in addition it is proposed that in ontogeny of any herpetozoan the greater the body weight the lesser the relative weight of the brain.

A plea is made for study of biometry, anatomy, and physiological aspects of the ecology of herpetozoa.

60. Sukhanov, V. B. (Academy of Science USSR, Paleontological Institute.) Locomotion in lizards and its bearing on locomotion in terrestrial vertebrates. (98 lines) Intercyclical asymmetrical locomotion - as in frogs, sea turtles, virds, pterodaurs - is based upon a type of appendicular coordination entirely different from that characteristic of the intracyclical symmetrical locomotion practiced by virtually all other tetrapods. From the primitive walk evolved the pace-walk and pace on one hand, the trot-walk and trot on the other. The pace-walk and pace are mechanisms available only to mammals. Fast movement in a rapid trot is inherent in such diverse groups as the iguanomorphs and the skinkogekkonomorphs. Most of the former lost their ability to move slowly, whereas the latter evolved a capacity to move slowly by reduction of the length of the hind legs and predominance of the forelegs in movement. The fast trot reliant upon the hind legs has led repeatedly to bipedalism, even in Permian archosaurs. A true trot does not occur in amphibians.

61. Tonorkova, L. Ia. (Ural'sk Univ.) Geographic variation in sharp-snouted frogs /Rana terrestris/. (38 lines)

62. Telepneva, V. P. (Leningrad Univ.) New data on Pliocene turtles in Moldavia and the Ukraine. (28 lines)

63. Flunt, V. E., Iu. A. Dubrovskiĭ and V. M. Neronov. (N. F. Gamalei Institute of Epidemiology and Microbiology.) Individual variability in coloration of Persian Contia and its bearing on subspecies structure. (26 lines)

64. Fomina, M. I. (Academy of Science, Uzbek SSR, Institute of Zoology and Parasitology.) Daily activity of the steppes viper /Vipera ursini/ under conditions of open air cage maintenance. (17 lines) Three hundred twenty /Vipera ursini/ were released under the natural conditions of an open-air cage, 19.5 x 15 m, in the Tashkent snake garden. In July-August, the snakes emerged from hiding as soon as the sun warmed the earth, and retired at air temperatures at ground level of 28-33° C. They remained in hiding as long as 19 hours, but emerged when ground-level air temperatures lowered to 22-25° C. In September the temperature dropped to and remained at 11-27° C; then the vipers were frequently found abroad near noon at temperatures of 18-25° C, were active all day on cloudy days, and fed at all times.

65. Khozatskiĭ, L. I. (Leningrad Univ.) Biomechanics of the integument of amphibians and reptiles. (97 lines)

66. Tsarevskiĭ, S. F. (Kazan.) Systematics of the "round-head" lizards (Phrynocephalus). (51 lines)

67. Chernomordikov, V. V. (Moscow Univ.) and Z. N. Kovaleva (Moscow Zoological Park.) Causes of gigantism in mesozoic reptiles. (23 lines, 1 table) Contrary to expectation for poikilotherms, our tests reveal that small lizards, snakes and

turtles consistently use more calories/kg/day than larger ones (a table gives data for three lizards of different species, three of snakes, two of turtles). Therefore one cause of gigantism in Mesozoic reptiles may have been the survival value of a size consistent with the greatest efficiency of use of food.

68. Shammakov, S. (Academy of Science, Turkmen SSR, Institute of Zoology and Parasitology.) On the number of species and individuals of reptiles of the small mountain ranges of western Turkmen. (21 lines) In the Kiuren-Dag (23 species), Malyi Balkhan (23 species) and Kara-Goz (14 species) ranges occur 29 species (19 lizards, nine snakes, one turtle). Agamids were the most abundantly encountered lizards (60.4%, 1.3/10 km), Eremias next (37.9%, 12.7/10 km). Vipers were the most abundant snakes (64%, 1.3/10 km). For every 10 km, 37.5 specimens of all reptiles were found, and of these 35 belonged to Agama, Phrynocephalus, Eremias and colubrid snakes. The greatest abundance occurred in Kiuren-Dag (41.3/10 km), the fewest in Kara-Ges (16.9/10 km), intermediate in Malyi Balkhan (32.6/10 km).

69. Shepilov, S. A. (Central Asiatic Zoological Center.) Distribution and differentiation of the reptiles in the mountain ridges in Nurata. (27 lines)

70. Shilova, S. A. (Moscow.) Food of the spadefoot toad /Pelobates fuscus/ in the southern forested Massifs. (18 lines) The spadefoot was found in most biotopes in the Kharkov and Kuibyshev regions, most abundantly in pines. In June-July activity begins at about 10:30 PM and continues to dawn. Beetles form most of the diet. Little selectivity is evident. Pests rarely are eaten. The spadefoot is of little economic value.

71. Shipilov, B. A. (Leningrad.) Daily cycle of activity of the grass frog /Rana temporaria/. (15 lines)

72. Shcherbak, N. N. (Academy of Science, Ukraine SSR, Zoological Institute.) The reptile as a model for study of the process of acclimatization in animals. (37 lines) Our studies on lizards of the Crimea show that color depends upon locality, and size and proportions of body depend upon ecological conditions. Bright lizards /Lacerta agilis/ are variable in color and pattern because they live in mountainous regions of varied ecology. In the Crimean lizard /L. taurica/ the number of blotches is directly dependent upon the aridity of the biotype. The Cliff lizards /L. saxicola/ of the Crimea which inhabit arid areas are grayer, less bright. Mapping of occurrence of melanistic reptiles shows that melanistic Common vipers /Vipera berus/ and Bright lizards are most often, or are exclusively, found in the steppe zone. Melanism in /V. berus/ is a phenomenon of later growth since normally-colored offspring are produced by melanistic females. Experiments are in progress to investigate the mechanisms of color change in reptiles.

73. Iur'ev, K. V. (Academy of Science USSR, Zoological Institute.) On the ossification of tendons of dinosaurs. (44 lines)

74. Iakovleva, I. D. (Academy of Science, Kirghiz SSR, Institute of Zoology and Parasitology.) On the subspecies of variegated lizards in Kirghiz. (27 lines) A statistical analysis of 324 examples of Eremias arguta shows that the population of the Chuiski Valley belongs to E. a. arguta, whereas that of Priissykkul' appears most similar to E. a. usbekistanica, but may be distinct. Solar radiation, resulting from high altitude (1600-2000 m) and isolation may account for differentiation of the Priissykkul' population.

NEWS FROM OUR UNIVERSITIES, MUSEUMS, ZOOS AND OTHER INSTITUTIONAL MEMBERS

Impressive New Aquarium and Reptile Building for Milwaukee County Zoological Park.

Scheduled for completion this fall, a near million dollar structure at the Milwaukee County Zoological Park will serve as both an aquarium and a reptile building.

The aquarium portion will contain three large exhibits: a 65,000 gallon exhibit, centrally located on the main floor, for North American game fishes; a 45,000 gallon tank for fresh-water porpoises, and an 8,000 gallon Amazon River exhibit. Filtering will be accomplished with DE and sand & gravel beds located in the basement. Two smaller (300 gallon) tanks for the display of salt water fish will round out the aquarium, which will be under the supervision of aquarist Ken Schoenrock.

Two thirty-five foot enclosures are planned for the reptiles, one for crocodilians and the other for large lizards. Both will include spacious pools, waterfalls, decorative rockwork and live plants. Three large cages, with pools, will be provided, each capable of housing four or more tanks for the exhibit of small reptiles and amphibians. One of these areas will be air-conditioned; another, de-humidified. Eighteen cages, three to nine feet wide, will house a variety of medium-size snakes and lizards, and an eight-foot cage/pool combination will serve for the exhibition of turtles.

All cages will be tile-walled and heating will be supplied by forced hot air passed over germicidal lamps. In order to meet the thermal requirements of individual species, thermostatically controlled heating coils will be located in each cage floor; in addition, a light fixture will be mounted above the ceiling of each cage so that heat or sun lamps may be added.

Some behind-the-scenes features will include: three shift areas for the safe management of King Cobras, Mambas, and the large boids, pythons, and lizards; a pull-cord snakebite alarm, circumventing the entire area of reptile exhibits; spacious service runs, eight feet wide, to facilitate the safe handling and maintenance of reserve specimens; separate offices for the aquarist and reptile supervisor; a keepers' lunch and locker room; a food storage and preparation room; and laboratory. A mouse room, reptile-holding room, and reserve fish pools will be included in the basement.

These facilities should provide a maximum in efficient operation and healthful management for a representative collection of reptiles, amphibians, and fish. At the same time, the building's interior and exterior decor will be pleasing to the eye, with fieldstone and tile highlighting the architect's design.

(—David Zucconi, Supervisor of Reptiles)

The University of Texas Dedicates New Field Laboratory.

The University of Texas at Austin opened the Brackenridge Field Laboratory, 2701 Lake Austin Boulevard, with formal dedication ceremonies on 21 April 1967. The Brackenridge Field Laboratory is designed for research on environmental factors controlling numbers and kinds of organisms. There are several large outdoor enclosures that can be manipulated so that certain environmental influences, such as temperature and light, can be altered while keeping other factors constant. These enclosures also permit investigators to regulate the numbers of predators or prey for studies of the interaction between organisms.

The morning dedication ceremonies included introductory remarks by University officials, Chairman of the Board of Regents, Frank Erwin, and Dr. J. T. Spencer, Director, Special Facilities and Programs, National Science Foundation. Dr. W. Frank Blair will serve as Director of the Brackenridge Field Laboratory.

After a barbecue lunch, there was a symposium entitled "Effects of Environmental Manipulations on Natural Populations." Speakers and their topics were: Donald S. Farner, University of Washington, "On the Use of Environmental Information in Control of Reproduction," H. G. Baker, University of California, "Genecology and Weediness in Ageratum (Compositae)," E. B. Edney, University of California, 'Water Balance in Some Desert Arthropods," and H. T. Odum, University of North Carolina, "Ecosystem Designs."

Evolutionary Biology Program at the University of Chicago.

The University of Chicago has recently begun a major expansion in the area of evolutionary biology. Degrees are granted by the Division of Biological Sciences (by the Division of Social Sciences for physical anthropology), and the program is interdepartmental. Research in areas joining traditional disciplines is emphasized as well as research within these disciplines.

Close ties are maintained with the Field Museum of Natural History and with the Brookfield Zoo. The Field Museum has important collections in the areas of paleontology, recent vertebrates and invertebrates, anthropology, and botany. The Brookfield Zoo is also one of the largest in the world and is unusually interested in pursuing the comparative investigations that are made possible by its collections. The breadth of the University's evolutionary biology program is increased by these cooperative arrangements. Close association is also maintained by individual faculty members with a number of marine and terrestrial biological laboratories throughout North and Central America, and field expeditions from the University and the Field Museum are made every year. Students are encouraged to partake in these expeditions whenever appropriate.

The doctoral program consists of about two years of courses and about three years of research. There

is a language requirement. The program is flexible and is constructed for the interests and needs of individual students.

Staten Island Zoo's Reptile Collection.

The reptile collection at Staten Island Zoo is by no means the largest in the Nation, let alone in the world (as has been stated from time to time in print, much to our embarrassment) but it is one of the outstanding collections in this country, and has for years enjoyed an international reputation for excellence.

Staten Island Zoo opened its doors for the first time in June of 1936, and has always emphasized the reptiles and particularly snakes. In recent years, partly by accident and partly by design, the rattlesnakes became a specialty of this collection. There were rarely less than two dozen forms on display at one time, among them some that had never been exhibited anywhere before. By 1941, the fifth year of the Zoo's existence, an impressive number of species had been acquired including such rarities as Crotalus unicolor, the Aruba Island Rattlesnake, Crotalus willardi, what was then called Willard's Rattlesnake, and a paratype of the then newly described Crotalus totonacus (G loyd & Kauffeld) now considered a race of C. d. durissus.

Conditions in our Zoo seem to favor the rattlesnakes, and some of them survive for a good many years. By virtue of this, the number of forms continued to increase until by 1960 it seemed there was a likelihood of our acquiring all the 32 species and subspecies of Crotalus and Sistrurus known to occur in the United States. This was finally accomplished by diligent exploitation of purchase, gift and exchange, and in no small part by personal collecting by members of the staff. By late 1964, we had 38 species and subspecies including all 32 U. S. forms. But our success was short-lived, for a few months later an epidemic carried off some of our best specimens of species of key importance. So it was that three specimens of the rare Chihuahua Ridge-nosed rattlesnake, Crotalus willardi silus, that had thrived for more than three years were among the casualties, together with others of which we had only single examples.

Happily the epidemic was rather speedily checked, and a year later we were complete once more in the United States series. At the time of writing, this series has been intact for nearly 17 months, and bids fair to continue so indefinitely. Meanwhile we have been building a duplicate series as stand-ins for many of the forms of which we have only one specimen, and some of which have grown old in our collection. Lacking only three or four forms, we now have a nearly duplicate series for the United States, and likely will complete it by the end of the year. At the moment we exhibit 37 forms, and in the course of the year, the total number of specimens hovered about 100 adult and subadult examples. Of these, 21 specimens of 17 forms have survived with us from five years to more than 12, and 32 specimens between two and five years. All are still living.

We believe that this is the largest aggregation of rattlesnakes, variety-wise, exhibited together in any one place at the same time, and that we are the first to exhibit all U. S. forms at one time. At least our claim has not been challenged. Only San Diego Zoo exceeds us in the number of kinds displayed over the years— more than 42 forms.

The collection otherwise contains much of interest. In addition to a number of different kinds of pythons, boas, mambas and vipers, we boast the only living U. S. example at the moment of the rare Black Desert Cobra, Walterinnesia aegyptia. Known only from a few preserved specimens, this rare snake had reached the United States alive only once, before we acquired our first specimen in early 1966. Unhappily, this snake lived only five days, but was replaced later in the year by a second which seems to be thriving. After we lost our first specimen, New York Zoo (Bronx) acquired one also but it has since died.

We also boast a two-headed turtle which fascinates the public but is of little scientific interest. Nevertheless, it is "cute"; the two heads are perfectly formed and completely separate, and the longer one looks at the more fantastic it seems. The specimen is a hatchling False Map Turtle, Graptemys p. pseudogeographica, shipped to a New York dealer in a batch of baby turtles from Louisiana. It seems to be thriving and has even shown some growth in the nearly six months we have had it.

During 1966 we exhibited 484 specimens of 128 species of reptiles; figures for the amphibians are not yet available.

(—Carl Kauffeld)

Information Services Available Through Subscription from the Institute of Scientific Information.

ASCA (Automatic Subject Citation Alert) is the first commercially available large scale computerized information system designed specially for the individual scientist. A scientist can indicate his subject interests by telling the ASCA system what words, word stems and phrases describe his areas of interest. The ASCA system then automatically sends him weekly computer printouts reporting new research of interest to him.

ASCA examines current journals as fast as they appear, extracts those items related to the scientist's selected interests, and mails him a personal computer printout each week. The report gives complete bibliographic data for the items retrieved. If no findings are made in a given week, the scientist still receives a report confirming that a search was conducted for him. The basic rate for ASCA is $100 per year.

Another service of ISI, Original Article Tear Sheet (OATS) service, includes a 24-hour telephone service for subscribers to provide greater convenience in obtaining original journal articles. Tear sheets are taken from extra copies of source journals in ISI's library and mailed to subscribers within hours after a request is received. Government procurement regulations permit grantees and contractors to charge information services (such as OATS) directly against grants or contracts.

ISI information services also include the sale of computer developed magnetic tapes to universities

and private industry. The interdisciplinary tapes are sold on a yearly subscription and delivered on a weekly basis. ISI Magnetic Tapes for 1967 contain information published in more than 1600 key scientific and technological journals from all over the world. Entries include research articles, reviews, meeting proceedings, letters to editors, and even references cited in the bibliographies of articles covered. For additional information, contact ISI, 325 Chestnut Street, Philadelphia, Pennsylvania 19106.

We reserve right to edit ads without consultation.

ATTENTION DEALERS: Am interested in obtaining the names and addresses of dealers and/or supply houses which specialize in the sale of reptiles and amphibians. Send price lists to: GEORGE M. BROOKS, Jr., 8122 S. Avalon, Chicago, Illinois 60619.

AMBYSTOMA INFO NEEDED: Am interested in corresponding with persons having experience in raising Ambystoma from larval stage to adult, with particular reference to histological development of teeth. Write to IRV R. RUEGER, 3601 Stratford Rd., Evansville, Indiana 47710.

DESIRE INFORMATION: Would like information and/or references on reptilian anatomy; also data on reptilian diseases, methods of treatment of effecting cure. Need names & addresses of reputable reptile dealers offering western, southern & exotic species. SYLVESTER E. DIETRICH, Route 2, #142, New Haven, Missouri 63068.

IMPORT INFO WANTED: Need info regarding restriction on importation of reptiles & amphibians from Switzerland to U. S. CHARLES D. MILLER III, c/o Pomfret School, Pomfret, Connecticut.

SEPARATES FOR SALE OR TRADE: My duplicates; for list write to: STEVEN WEINKSELBAUM, 3010 Clarendon Rd., Brooklyn, New York 11226.

DIRECTORY: Am interested in accumulating info on all professional & amateur herpetological societies in U. S. with objective of preparing a directory of same. Need addresses and brief description of each. STEVE SCHMIDT, 549 Forest Dr. SE, Cedar Rapids, Iowa 52403.

SNAKE HEALTH: Request information on methods of ridding ticks from snakes & cages. Contact: C. C. BLACKWELL, Jr., 4550 West 26th Street, Chicago, Illinois 60623.

NEW SOCIETY: Our members in Chicago & surrounding environs should note the formation of the Chicago Herpetological Society. The CHS meets monthly and publishes a bulletin. Interested persons should write to: JAMES E. SEYMOUR, 4132 N. Clarendon Ave., Chicago, Illinois 60613.

SUPPORT NEEDED: Kentucky Chapter of Nature Conservancy is fighting to save the well-known "Murphy's Pond", an area in southwestern Kentucky noted for its varied reptile & amphibians fauna, and one of the last natural stands of cypress in the north Mississippi River basin. Contributions are greatly needed and may be directed to: THE NATURE CONSERVANCY, Kentucky Chapter, P. O. Box 5005, University Station, Lexington, Kentucky 40506.

LITERATURE WANTED: Wish to obtain original copies of both volumes of Schneider's Historiae Amphibiorum, 1799 & 1801. JOSEPH T. COLLINS, 5807 Montgomery Road, Cincinnati, Ohio 45212.

PENNSYLVANIA MATERIAL OFFERED: Members in need of material from the Allegheny Mountain section of wouthwestern Pennsylvania are invited to contact RAY ASHTON, Jr., 550 S. Main Street, Oxford, Ohio.

Send ads to C. J. Hirschfeld, Ed., 9045 Indian Ridge Rd., Cincinnati, Ohio 45243

LORQUINIA. Complete sets of this journal of the Lorquin Natural History Club of Los Angeles are still available from the Southern California Academy of Sciences, Los Angeles County Museum, Exposition Park, Los Angeles, California 90007 (Vol. 1-2, 1916-1919, $1.00 complete set). Included are several herpetological papers on the southwest by H. Hillman, P. D. R. Ruthling, and others.

MICROFICHE. Microfacsimiles of books on transparent sheets of safety film, size 9 x 12 cm, each card containing 40-70 pages of material. Several herpetological titles are available. Complete catalogue of books and periodicals on microfiche is available from Inter Documentation Co., Poststrasse 9, Zug, Switzerland. List of herpetological titles will appear in next issue of the Review.

review

NATURAL HISTORY OF COTTONMOUTH MOCCASIN, AGKISTRODON PISCIVORUS (REPTILIA). By Ray D. Burkett. University of Kansas Publications, Museum of Natural History, 17(9): 435-491. 7 figs, 13 tables, 1966.

This is another in the important series of studies on the natural history of reptiles and amphibians that have emanated under the guidance of Henry S. Fitch from The University of Kansas Natural History Reservation during the last decade.

The present publication is the result of study of 306 cottonmouth moccasins and at least 115 references published within the years 1895-1963. Unfortunately, most of the snakes were already preserved when studied. This is not to say that Burkett has not used well his preserved material or the 25 live cottonmouths that he kept in the laboratory for the purpose of studying behavior, fang shedding and for comparison of measurements with preserved specimens. It is to say that in reading this monograph one is continually aware of the lack of information that might have been gained from a long term marking study of a natural cottonmouth population. Field data on movement, home range, population turnover, reproductive success and so on would have greatly contributed to a study of the natural history of the cottonmouth. I am fully aware of the difficulties, temporal and others, in obtaining such data. Nevertheless, while we await that kind of information which is slowly being retrieved we can be thankful for Ray Burkett's informative study of one of the often written about, but previously little known snakes of the United States.

Information is presented on systematics, distribution, description, habitat and limiting factors, reproduction, growth and development, shedding, food habits, mortality factors, behavior, venom and the bite. There is also a case history of a bite and a review of treatment. The author's objectives were to (1) learn as much as possible concerning the natural history and economic importance of the cottonmouth; (2) determine what factors limit its geographic distribution; (3) determine the role of the cottonmouth in its ecological community and (4) compare the cottonmouth's life history with that of other crotalid snakes, especially the kinds that are most closely related to it.

The omission of pertinent literature is a shortcoming that is not restricted to me. It is also seen in Burkett's study. It would not seem unreasonable to expect citation of the admittedly very meager information on movement of a marked cottonmouth in a Louisiana swamp (Tinkle, 1959, Amer. Midland Nat., 62(1): 189-205) or the observation of Rossman (1960 [1959] Jour. Florida Acad. Sci., 22: 207-225) on a 1067 mm cottonmouth that regurgitated a 940 mm mud snake or perhaps that of Petzold (1963, Bijdr tot de Dierkunde, 33: 61-69) on reproduction and juvenal development. The ease of monographers in overlooking references needs no explanation.

Several conclusions of general interest can be briefly mentioned. The northern edge of the cottonmouth's geographic range is apparently limited by low temperatures in winter; the western edge of the range is probably limited by the lack of favorable habitats that have resulted from insufficient precipitation. On the basis of old distributional records it appears that the range of the cottonmouth has decreased in the last 100 years.

Interestingly, Burkett concludes that the mature female cottonmouth usually bears young every other year, a conclusion supported by the Florida field study of Wharton (1966, Copeia: 149-161). In my judgement the objective that is the least well achieved is the attempt to define the role of the cottonmouth in its ecological community. That kind of precise information is just not available.

Perhaps the relationship between riches and virtue as stated by Plato is pertinent to many combination field and laboratory studies. Plato wrote that when riches and virtue are placed together in the scales of the balance, the one always rises as the other falls. The advantages of combining information from the laboratory and the field study of organisms are clear. We may hope for the golden mean of Aristotle in future studies of the natural history of reptiles and amphibians but there is nothing here to suggest that Burkett does not realize this nor that he has not made a worthy contribution to our knowledge of the cottonmouth.

A Field Guide to Western Reptiles and Amphibians, by Robert C. Stebbins. 1966. Houghton-Mifflin Co., Boston. 279 p., 39 pls (mostly in color) $4.95.

The Reptiles of Japan, by Richard C. Goris. 1966. Shogakkan Publ. Co., Tokyo. 127 p., 16 color p. & 8 monochrome p., hard cover. $5.90 postpd. from publisher or author (Ikuei Technical College, Igusa 2-35-11, Suginami-ku, Tokyo, Japan). Every Japanese mainland reptile represented in color; both adult and juvenile forms shown when color & pattern differ. All photos original by author and over half illustrate animals never before represented photographically in the literature. Text in Japanese.

Of Scientists and Salamanders, by Victor Twitty. 1966. W. H. Freeman Co., San Francisco. 178 p. 57 illus. $4.50.

La Taxonomia y Zoogeografia de los Ophidios de Venezuela, by Jania A. Roze. 1966. Univ. Central de Venezuela, Caracas. 362 p., 80 maps, 79 figs., paper bound.

An English-Classical Dictionary for the Use of Taxonomists, compiled by Robert S. Woods. 1966. Pomona College, Claremont, California. $5.50 (from Rm. 201, Sumner Hall, Pomona College).

A Contribution to the Herpetology of West Pakistan,

by Sherman A. Minton. Bull. Amer. Mus. Nat. Hist., 134: 27-184. $5.00 from the Museum, New York.

Comparative Osteology and Evolution of the Lungless Salamanders, Family Plethodontidae, by David B. Wake. 1967. Southern California Academy of Sciences, Memoir no. 4. 111 p., 33 figs. $6.50 (order from Los Angeles County Museum of Natural History, 900 Exposition Boulevard, Los Angeles, California 90007).

Phylogenetic Systematics, by W. Hennig, trans. from the German by D. D. Davis and R. Zangerl. Univ. Illinois Press, Urbana. $12.50.

The Tuatara, Lizards and Frogs of New Zealand, by R. Sharell. 1966. 94 p., 52 colored & 18 black & white photographs, cloth. $4.20 from Wheldon & Wesley, Ltd., Codicote, Hitchin, Herts., England.

The Principal Diseases of Lower Vertebrates, by H. Reichenback-Klinke & E. Elkan. 1965. Academic Press, N. Y. xii + 600 p. $20.00. Includes information on fish, amphibians and reptiles; how to keep them as pets or in research labs.

Fauna Japonica, Anura (Amphibia), by Y. Okada. 1966. Biogeographical Soc. Japan. 234 p., 24 pls. (3 in color), clothbound, in English. $19.00 from Biogeogr. Soc. Japan, National Science Museum, Uyeno Park, Taito-ku, Tokyo. Forthcoming additions to this series include volumes on snakes by Okada, Koba & Matsui, lizards by Matsui, and on salamanders by Okada.

Men and Snakes, by Ramona & Desmond Norris. 1965. McGraw Hill, San Francisco & New York. 224 p. ca. $7.00.

Poisonous Snakes of Southern Africa, by John Visser. 1967. Price R4.50, postage 15 c, from Howard B. Timmins, Colophon House, Cape Town, South Africa. Chapters are: 1. Poisonous snakes of southern Africa and the effects of their venoms. 2. Factors affecting the severity of snakebite. 3. Antivenoms-spedificity, indications, and precautions. 4. Treatment of snakebite, first-aid and medical. 5. Appendices, First-Aid measures; Case histories; Snakes in general, questions & answers.
